A wager is therefore merely a debt of honor, and if paid it is in the eye of the law the same thing as giving a gratuity, except perhaps as to the liability of a principal to reimburse his agent when the latter has paid it because in honor bound.

Wagnerism (våg'nê'r-izm), *n.* [*< Wagner + -ism.*] 1. The art theory of Richard Wagner, especially as concerns the musical drama, including the general style of composition based on that theory. Among the many characteristics of the theory are these: the choice of a general subject in which the mythical and heroic elements are prominent; the amalgamation of poetry, music, action, and scenic effect into the most intimate union as equally important cooperating elements; the desertion of the conventionalities of the common Italian opera, especially of its sharply defined and contrasted movements and its tendency to the display of mere virtuosity; the abundant use of leading motives as a means to continuous and reiterated emotional effect; the immense elaboration of the orchestral parts, so that in them is furnished an unbroken presentation of or commentary on the entire plot; and the free

use of new and remarkable means of effect, both scenic and instrumental. The *Wagnerian* ideal is often called (sometimes derisively) "the music of the future," from the title of one of Wagner's essays. While *Wagnerism* is best exemplified in the great dramas of Wagner himself, its qualities may be seen more or less in almost all the dramatic music of the last half of this century.

A chain used to prevent a wheel from turning in descending a hill, by locking the wheel to the body of the wagon, is essentially a wagon-locking device, but the term in the United States always implies some form of friction-hand-brake. *Wagon-locks* are used on stages and other vehicles in mountainous districts, and are preferred to the wheel-

E. Jonson, Staple of News, li. 1.

2. The act of watching or keeping vigil, especially for a solemn or festive purpose; a vigil; specifically, an annual festival kept in commemoration of the completion and dedication of a parish church; hence, a merrymaking; a festive gathering. The wake was kept by an all-night watch in the church. Tents were erected in the churchyard to supply refreshments to the crowd on the following day, which was kept as a holiday. Through the large attendance from neighboring parishes at wakes, devotion and reverence gradually diminished, until they ultimately became mere fairs or markets, characterized by merry-making and often disgraced by indulgence and riot. In popular usage this word has the same meaning as *vigil*. The wake or revel of country parishes was, originally, the day of the week on which the church had been dedicated; afterward, the day of the year. In 1536 an act of convocation appointed that the wake should be held in every parish on the same day, namely, the first Sunday in October; but it was disregarded. Wakes are expressly mentioned in the "Book of Sports" of Charles I. among the feasts which should be observed. The wake appears to have been also held on the Sunday after the day of dedication; or, more usually, on the day of the saint to whom the church was dedicated. In Ireland it is called the *patron day*. Brand, Popular Antiquities.

He is wit's pedler, and retails his wares
At *wakes* and wassails, meetings, markets, fairs.
Shak., L. L. L., v. ii. 318.

Didsbury Wakes will be celebrated on the 8th, 9th, and 10th of August [1825]. . . . The enjoyments consist chiefly of ass-races, for purses of gold; prison-bar playing, and grinning through collars, for ale; . . . and balls each evening.
Quoted in *Home's Year Book*, col. 958.

3. An all-night watch by the body of the dead, before burial. This custom seems to be of Celtic origin, and is now characteristic of Ireland, or of the Irish in other countries; but it was formerly observed in Scotland and Wales. It probably originated from a superstition that the body might be carried off by invisible spirits, or from a more rational fear of injury to it from wild beasts. In early literature it has the name of *likewake*, *lichwake*. The wake was originally a combination of mourning for the dead and rejoicing in his memory and for his deliverance, but in later times has often degenerated into a scene of wild grief and gross orgies. See *likewake*.

How that the *liche-wake* was y-holde
Al thilke night. Chaucer, Knight's Tale, l. 2100.

The *late-wake* is a ceremony used at funerals. The evening after the death of any person, the relations and friends of the deceased meet at the house, attended by a bagpipe or fiddle; the nearest of kin, be it wife, son, or daughter, opens a melancholy ball, dancing and greeting, i. e. crying violently, at the same time; and this continues till daylight, but with such gambols and frolics among the younger part of the company that the loss which occasioned them is often more than supplied by the consequences of that night. If the corpse remain unburied for two nights, the same rites are renewed.
Pennant, Tour in Scotland, p. 112.

3. A place to which an animal, as a buffalo, resorts to wallow; also, the traces of its wallowing left in the mire. Some localities called by this name (notably the "hog wallows" of the San Joaquin Valley, in California) are on too large a scale to have been formed in this way. Their origin has not been satisfactorily explained.

They had come to an alkali mud-hole, an old buffalo-wallow, which had filled up and was covered with a sun-baked crust, that let them through as if they had stepped on a trap-door.

T. Roosevelt, The Century, XXXV. 658.

'foreign nut' (so called with ref. to Italy and France, whence the nut was first brought to the Germans and English), *< wealh*, foreign (see *Welsh*), + *hnutu*, nut. Cf.

walshnut.] 1. The fruit of the nut-bearing tree *Juglans regia*; also, the tree itself, or its wood. The walnut-tree is native from the Caucasus and Armenia to the mountains of northern India, and is extensively cultivated, and in some places naturalized, in temperate Europe. It grows from 40 to 60 or even 100 feet high, with a massive trunk and broad spreading top, and bears pinnate leaves with few smooth leaflets. It produces the well-known sweet-seeded nuts of this name, in America distinguished as *English walnuts*. These are surrounded with a thin, brittle, and easily separated husk. The shell is thin in different degrees, or in the wild state thicker. The kernel yields some 50 per cent. of oil, which is largely expressed in France and other parts of Europe, as also in Asia. That of the first pressing is used for food, like olive-oil, though ranked less highly; that of the second pressing, called *fire-drawn*, the cake having been submitted to boiling water, is more siccative even than linseed-oil, and hence is by some artists the most highly esteemed of all oils; it is a good lamp-oil, and is available for making soft-soap, etc. The whole fruit when quite young makes a good pickle. The shell of a large variety, called *double walnut*, is used in France for making purses, cases for jewelry, etc. The leaves and the hull of the fruit are used in Europe for various medicinal purposes. Walnut-wood is light, tough, and handsome, plain or with a bur; before the introduction of mahogany it was the leading cabinet-wood of Europe, and is still preferred to all other wood for gunstocks.

In parts of New York, New England, and some other localities, same as *hickory-nut* or *hickory*. This is sometimes distinguished as *shagbark* or *shell-bark walnut*.—**Ash-leaved walnut.** Same as *Caucasian walnut*.—**Belgaum walnut.** Same as *Indian walnut*.—**Black walnut,** n. North American tree, *Juglans nigra*, or its timber. The tree ranges, in rich bottom-lands and on hillsides, through a large part of the eastern half of the United States, but is becoming scarce. It grows from 90 to 140 feet high, with a trunk from 6 to 9 feet in diameter. The wood is heavy, hard, and strong, easily worked, and susceptible of a beautiful polish; it is purplish-brown when first cut, but becomes darker with age. It is more generally used for cabinet-making, inside finish, and gunstocks than any other North American tree. (*Sargent*.) The nuts are edible, but not very choice; the shell is hard, the husk thick and difficult to remove. The tree grows rapidly, and is more or less planted on the prairies.

They have a sort of walnut they call *black walnuts*, which are as big again as any I ever saw in England, but are very rank and oily, having a thick, hard, foul shell, and come not clear of the husk as the walnut in France; doth; but the inside of the nut, and leaves, and growing of the tree declare it to be of the walnut kind.

'horse-whale,' a name prob. alluding to the noise made by the animal, somewhat resembling a neigh, = Sw. Dan. *hvalfisk*: see *whale*¹ and *horse*¹. Cf. *whalefish* and *narwhal*.] Any member of the family *Trichechidae* (or *Rosmaridae*); a very large pinniped carnivorous mammal, related to the seals, having in the male enormous canine teeth protruding like tusks from the upper jaw. The common walrus, *T. rosmarus*, the morse, sea-horse, sea-ox, or sea-cow, attains a total length of 10 to 12 feet in the full-grown male; individuals are reported to exceed 14 feet; a more nearly average length is 8 to 10 feet, with a girth of about as much. A weight of 2,500 to 3,000 pounds is acquired by old bulls, with a yield of 500 pounds of blubber. The whole length of the canines is about 2 feet, when they are full-grown, with a projection of 15 inches or more. These teeth are used in digging for the clams which form the principal food of the animal, and in climbing over uneven surfaces of rock or ice. A walrus 12 feet long has the fore flippers 2 feet long by about 1 foot broad; the flukes each about this length, but 2 feet in extreme breadth when pressed out flat. The mammae of the female are two pairs, respectively abdominal and inguinal. Young and middle-aged individuals of both sexes are covered with a short coarse hair of a yellowish-brown color, deepening into dark reddish-brown on the belly and at the bases of the limbs. Old animals, especially the bulls, become almost naked, and the skin grows heavily wrinkled and plaited, especially on the fore quarters. In the glacial period the walrus ranged in North America southward on the Atlantic coast to South Carolina. There is no evidence of its existence in New England since about 1550; from this date to 1600 it lived south to Nova Scotia. It now inhabits some parts of Labrador, shores of Hudson's Bay, Greenland, and arctic regions as far north as Eskimos live or explorers have gone. It has been found in Scotland of late years, and on or off the arctic coasts of Europe and Asia, especially in Spitzbergen and Nova Zembla. It is readily captured, and the systematic destruction to which it has long been subjected has materially diminished its numbers in many different places. The blubber yields a valuable oil; from the hide a very tough and durable leather is made; and the tusks yield a superior ivory. The walrus of the North Pacific is now generally thought to be specifically distinct, and is known as *T. or R. obesus*, and

waltz (wálts), *n.* [= F. *valse* (> E. *valse*), < G. *walzer*, a round dance, *waltz*, < *walzen*, roll: see *walt*, *v.*] **1.** A round dance, probably of Bohemian origin, which has been extraordinarily popular since the latter part of the eighteenth century. It is danced by couples, the partners in each couple moving together in a series of whirling steps—either advancing continuously in the same direction, or varying this with "reversing" or turning the opposite way. The regular form of the waltz is known as the *trois-temps*: the more rapid form *deux-temps* containing six steps to every two of the other. The derivation of the waltz is disputed, the French often claiming its descent from the volta, and the Germans from the allemande; but it is probably a development of the slow and simple ländler. Its popularity has decidedly overshadowed that of all other fashionable dances.

2. Music for such a dance, or in its rhythm, which is triple and moderately quick. *Waltzes*

are usually made up of sections of eight or sixteen measures. Several such sections are often written to be performed in succession, and are then provided with an introduction and a coda.—**Deux-temps waltz.** See *deux-temps*.

pierced and strung, used as money and for ornament by the North American Indians. The shell was cut away, leaving only a cylinder like a European bugle. Wampum was of two kinds, white and black or dark-purple. An imitation of wampum consisting of white porcelain beads of the same shape has been made by Europeans for sale to the Indians. See the second quotation under *wampumpeag*.

Ye said Narigausets . . . should pay . . . 2000 fathom of good white *wampame*.

Sachems of Long Island came voluntarily, and brought a tribute to us of twenty fathom of *wampom*, each of them.
Winthrop, Hist. New England, I. 283.

The Indians are ignorant of Europe's Coyne; yet they have given a name to ours, and call it monéash from the English money. Their own is of two sorts: one white, which they make of the stem or stocke of the Periwinkle, which they call *Meteahcock*, when all the shell is broken off: and of this sort six of their small Beads (which they make with holes to string the bracelets) are current with the English for a Penny. The second is black, inclining to blew, which is made of the shell of a fish, which some English call *Hens, Poquaehock*, and of this sort three make an English penny. . . . This one fathom of this their stringed money, now worth of the English but five shillings (sometimes more), some few yeeres since was worth nine, and sometimes ten shillings per Fathom. . . . Obs: Their white they call *Wampam* (which signifies white); their black *Sneckahock* (*Säck* signifying blacke). Both amongst themselves, as also the English and Dutch, the blacke penny is two pence white.

Winthrop, Hist. New England, I. 143.

There was no currency, before this time, . . . unless we choose to give the name of currency to the *wampum*, or *wampumpeage* (as it is more properly called), of the Indians. . . . Peage was the name of the substance, which was of two kinds—black and white. *Wampama*, or *wompam*, is the Indian word for white, and as the white kind was the most common, *wampumpeage* got to be the common name of this substance, which was usually abbreviated into *wampum*. The black peage consisted of the small round spot in the inside of the shell, which is still usually called in this neighborhood by its Indian name of quahog. These round pieces were broken away from the rest of the shell, brought to a smooth and regular shape, drilled through the center, and strung on threads. The white peage was the twisted end of several small shells, broken off from the main part. These portions of shell, thus strung, were worn as bracelets and necklaces, and wrought into belts of curious workmanship. They thus possessed an intrinsic value with the natives, for the purposes of ornament; and they were readily taken by them in exchange for their furs.
E. Everett, Orations, I. 124.

wapiti (wɒp'i-ti), *n.* [Also *wapitti*, *wapite*, *wap-pite*; *< Amer. Ind. (Crete) wapitik*, 'white deer,' said to designate the Rocky Mountain goat, *Haploceerous montanus*; used as E., and also in the NL. form *Cervus wapiti*, by B. S. Barton, in 1809, for the animal defined.] The North American stag or elk, *Cervus canadensis*, which is the North American representative of the stag or red deer of Europe, and resembles the latter, though it is much larger and of a stronger make, being one of the largest living representatives of the family *Cervidae*. *Wapiti* is chiefly a book-name of this deer, which has generally been known since about 1809 as the *elk*—a name applied in Europe to a very different animal, corresponding to that called *moose* in North America. (See *elk* (with cut), *moose*, *stag*.) The full-grown male *wapiti* may exceed a height of 16 hands at the withers, and acquire a weight of more than 1,000 pounds, though not averaging over 600; the form is short for its stature. The coat is some shade of yellowish-gray or brownish-gray, darkening to chestnut-brown on the head,

neck, and limbs, even blackening on the belly; on the rump is a white patch bordered with black and extending into the groin; the tail is extremely short. The antlers are very long, with comparatively slender, cylindrical, and regularly curved beam, giving off in front the brow- and bez-antlers close together, the royal at end of first third

of the beam, a large sur-royal at end of second third, and then forking dichotomously (only exceptionally acquiring any palmation like the crown of the European stag). A pair of good-sized antlers may weigh, with the skull, 50 or 60 pounds, measure 4 or 5 feet along the curve of the beam, and spread 3 or 4 feet apart. The venison is well flavored and highly nutritious. The wapiti has inhabited North America from the Atlantic to the Pacific, and from Mexico to about 57° in the interior; but it has been hunted out of nearly all its range, and is now found chiefly in the Rocky Mountain region of the United States, especially of the Upper Missouri and Yellowstone rivers. It is gregarious, goes in herds or droves sometimes of many hundreds, is slaughtered with little difficulty, and would soon become extinct were no measures taken for its preservation.

werre (also cited in AL. as **war*, in comp. *war-scot*), < OF. *werre*, *guerre*, F. *guerre* = Pr. *guerra*, *gerra* = Sp. Pg. It. *guerra*, war, < ML. *werro*, war, < OHG. *werra*, vexation, strife, controversy, confusion, broil = MD. *werre* = MLG. *werre*, strife, war, hostility), < *werran* (*für-werran*), MHG. *werren* (*ver-werren*), G. *wirren* (*ver-wirren*), confuse, entangle, embroil, = MD. *werren* (*ver-werren*), embroil, entangle; akin to E. *worse*: see *worse*, and ef. *war*², ult. a var. of *worse*. The F. *guerre* appears in the phrase *nom de guerre*, and the Sp. in the dim. *querrilla*. Hence *war*¹, *v.*, *warray*, *warrior*, etc.] 1. A contest between nations or states (*international war*), or between parties in the same state (*civil war*), carried on by force of arms. International or public war is always understood to be authorized by the sovereign powers of the nations engaged in it; when it is carried into the territories of the antagonist it is called an *aggressive* or *offensive war*, and when carried on to resist such aggression it is called *defensive*. Certain usages or rights of *war* have come to be generally recognized and defined under the name of the *Laws of War*, which in general (but subject to some humane restrictions which in recent times have been greatly increased) permit the destruction or capture of armed enemies, the destruction of property likely to be serviceable to them, the stoppage of all their channels of traffic, and the appropriation of everything in an enemy's country necessary for the support and subsistence of the invading army. On the other hand, though an enemy may be starved into surrender, wounding, except in battle, mutilation, and all cruel and wanton devastation are contrary to the usages of war, as are also bombarding an unprotected town, the use of poison in any way, and torture to extort information from an enemy: but it is admitted that an enemy may be put to death for certain acts which are in themselves not criminal, and it may be even highly patriotic and praiseworthy, but are injurious to the invaders, such as firing on the invaders although not regularly enrolled in an organized military force, or seeking to impair the invaders' lines of communication.

2. Specifically, any one of a great number of small oscine passerine birds, or dentivorastral insectivorous birds, of different families and many different genera, of both the Old World and the New. Especially—(a) A bird of the group composing the family *Sylviidae*, or Old World warblers, with scarcely any representatives in America. This is one of the most extensive and varied groups of its grade in ornithology, now generally rated as only a subfamily (*Sylviinae*) of *Turdidae*. These warblers are all small, active, sprightly birds, and many are remarkable for their clearness, sweetness, and flexibility of their song. Among typical warblers of the subfamily *Sylviinae* may be noted the species of *Sylvia*, the leading genus, as the blackcap and whitethroat; of *Melospiza*, as the Dartford warbler; of *Regulus*, as the goldcrest; of *Phylloscopus*, as the willow-warbler; of *Aedon*, as the rufous warbler; of *Hippolais*, as the icterine warbler; of *Acrocephalus*, as the reed- or sedge-warbler; of *Locustella*, as the grasshopper-warbler; of *Cettia*, as Cetti's warbler. Besides these, the accentor or hedge-sparrow, the nightingale (*Dunlin luscinius*), the redbreast (*Erythacus rubecula*), the bluethroat, redstart, whinchat, stonechat, etc., have been brought under the definition of *warbler*, as members of the sylvine group. (b) In the United States, a bird of a different family, the American warblers, *Dendroicae* or *Mniotiltidae*, a smaller and more compact group than the *Sylviidae*, though the species are still very numerous and diversified. Few of them are noted for musical ability. The leading representatives of the American warblers are the numerous wood-warblers of the genus *Dendroica*; the worm-eating warblers, *Helminthia* and *Helminthophaga*; the creeping warblers, *Mniotilta* and *Parula*; the ground-warblers, as *Geothlypis*; the chat, *Icteria*; the water-thrushes, *Seiurus*; the fly-catching warblers, *Myiodiocetes*, *Setophaga*, and many others of tropical America.

This bird was also called *collared star* by Latham the same year, having been described by Scopoli in 1769 as *Sturnus collaris*.—**Aquatic warbler** (Latham, 1783), one of the reed-warblers, probably *Acrocephalus aquaticus*; formerly called *Sylvia* or *Salicaria* or *Calamophila aquatica*.—**Audubon's warbler**, *Dendroica auduboni*, the western representative of the yellow-rump or myrtle-bird, and equally abundant. It differs chiefly in having the throat yellow instead of white. Also called *western yellow-rump*.—**Autumnal warbler**, the young of the bay-breasted warbler, mistaken for a distinct species. A. Wilson, 1811.—**Azure warbler**, the cerulean warbler.—**Babbling warbler** (Latham, 1783), the lesser whitethroat, *Sylvia curruca*. See *whitethroat*, 1.—**Bachman's warbler** (named after the American naturalist John Bachman (1790-1874)), *Helminthophaga bachmani* of the southern United States and some of the West Indies. (Audubon, 1834.) It is one of the swamp-warblers, and still very rare, though it has been quite recently found to be common in some localities.—**Barred warbler**, *Sylvia nisoria* of Europe, Asia, and Africa.—**Bay-breasted warbler**, *Dendroica castanea* of eastern parts of North America. The adult male has the whole breast chestnut.—**Belted warbler**, the yellow-rumped warbler. See cut under *Mniotilta*.—**Black-and-yellow warbler**, *Dendroica maculosa*. See cut under *spotted*.—**Blackburnian warbler**, *Dendroica blackburnia*, the prometheus warbler. In adult plumage extensively black varied with white, the breast and some parts about the head of a flaming orange. It is the most richly colored of the warblers, and is common in many parts of North America. It was named by Latham in 1783 after a Mrs. Blackburn of London.—**Black-capped warbler**, the black-cap, *Sylvia* (often *Curruca*) *atricapilla*, of nearly all Europe, and parts of Asia and Africa.—**Black-headed warbler**, the American redstart, *Setophaga ruticilla*. See cut under *redstart*. Latham, 1783; Pennant, 1785.—**Black-poll warbler**, *Dendroica striata*, when adult having the whole crown black, the upper parts olivaceous streaked with black, and the under parts white streaked with black along the sides. In young plumage it is hardly to be distinguished from the bay-breasted warbler. It is very wide-ranging, from Greenland and Alaska through most of America (probably to Chili). It was originally described in 1772 by J. K. Forster from Hudson's Bay as the *striped fly-*

catcher.—**Black-throated blue warbler**, *Dendroica cerulea*, of eastern North America, remarkable for the unusual difference of the sexes in plumage. The term *washing* is, however, more especially used to designate the separation of gold from the detrital formation in which it so frequently occurs. The same term is also commonly employed to designate the process of separating coal from various impurities which frequently occur intermingled with it, such as shale, pyrites, argillaceous iron ore, gypsum, etc. The machines by which this is done are called *coal-washers*, as machines for washing gold are called *gold-washers*. *Washing* is also the term in general use for designating the operation of cleansing the ore when, as is frequently the case, it comes from the mine mixed with clay or dirt (material which cannot properly be called *gangue*). This is a coarse operation, which is sometimes a necessary preliminary to the operations of sizing and dressing, or concentrating, as sometimes called.—To *wash* one's hands off. See *hand*.

6. The period of time during which one person or body of persons watch or stand sentinel, or the time from one relief of sentinels to another; hence, a division of the night, when the precautionary setting of a watch is most generally necessary; period of time; hour. The Jews, like the Greeks and Romans, divided the night into military watches instead of hours, each watch representing the period for which each separate body of sentinels remained on duty. The proper Jewish reckoning recognized only three such watches: the first (lasting from sunset till about 10 P. M.), the second or *middle watch* (10 P. M. to 2 A. M.), and the third, or *morning watch* (from 2 A. M. till sunrise). After the establishment of the Roman power they were increased to four, which were named as *first*, *second*, etc., or by the terms *even*, *midnight*, *cock-crowing*, and *morning*, these terminating respectively at 9 P. M., midnight, 3 A. M., and 6 A. M.

7. *Naut.*: (a) The period of time occupied by each part of a ship's crew alternately while on duty. The period of time called a *watch* is four hours,

the reckoning beginning at noon or midnight. Between 4 and 8 P. M. the time is divided into two short watches, or *dog-watches*, in order to prevent the constant recurrence of duty to the same portion of the crew during the same hours. Thus, the period from 12 to 4 P. M. is called the *afternoon watch*, from 4 to 6 the *first dog-watch*, from 6 to 8 the *second dog-watch*, from 8 to 12 the *first night watch*, from midnight to 4 A. M. the *middle watch*, from 4 to 8 the *morning watch*, and from 8 to 12 noon the *forenoon watch*. When this alternation of watches is kept up during the 24 hours, it is termed having *watch and watch*, in distinction from keeping all hands at work during one or more watches.

After 2. or 3. *watches* more we were in 24. fadoms.

Quoted in *Capt. John Smith's Works*, I. 112.

(b) A certain part of the officers and crew of a vessel who together attend to working her for an allotted time. The crew of every vessel while at sea is generally divided into two parts: the *starboard watch*, which in the merchant service is the captain's watch, and is often commanded by the second mate; and the *port or larboard watch*, which in the merchant service is commanded by the chief mate. In the British and United States navies these watches are commanded by the lieutenants successively. The *anchor-watch* is a small watch composed of one or two men appointed to look after the ship while at anchor or in port.

8. Anything by which the progress of time is perceived and measured. (at) A candle marked out into sections, each of which required a certain time to burn.

Shak., *Rich. III.*, v. 3. 63.

(b) A small portable timepiece or timekeeper that may be worn on the person, operated by power stored in a coiled spring, and capable of keeping time when held in any position. Watches were invented at Nuremberg about the beginning of the sixteenth century, and for a long time the wearing of a watch was considered in some degree a mark or proof of gentility. Thus Malvolio remarks in anticipation of his great fortune:

I frown the while; and perchance wind up my *watch*, or play with my—some rich jewel. *Shak.*, *T. N.*, ii. 5. 66.

The new contrivance of applying precious stones to *watches* I had the good fortune to see when Mr. Faelo, the inventor, and an ingenious man, and Mr. Debaufre, the workman, presented their *watches*, to have the approbation of the Royal Society.

W. Derham (Ellis's Lit. Letters, p. 173).

A friend of mine had a *watch* given him when he was a boy, a "bull's eye," with a loose silver case that came off like an oyster-shell from its contents; you know them—the cases that you hang on your thumb, while the core, or the real *watch*, lies in your hand as naked as a peeled apple.

—**Watch and ward.** The old custom of watching by night and by day in towns and cities. English writers up to the seventeenth century recognize a distinction between *watch* and *ward*, the former being used to signify a watching and guarding by night, and the latter a watching, guarding, and protecting by day. Hence, when the terms were used in combination, especially in the phrase to *keep watch and ward*, they implied a continuous and uninterrupted watching and guarding, constant vigilance and protection by night and by day.

Another form consists of a fixed clock, having a key that must be touched to make the record, a clock being placed at each station. Another and now more common form is a clock placed at a central station, and connected by wires with the place where the watchman makes his rounds; at each station the watchman touches a push-button to close the circuit and print a mark on a dial in the clock.

1. A transparent, inodorless, tasteless fluid, H₂O. Water is a powerful refractor of light and an imperfect conductor of heat and electricity; it is very slightly compressible, its absolute diminution for a pressure of one atmosphere being only about one twenty-thousandth of its bulk. Although it is colorless in small quantities, it is blue like the atmosphere when viewed in mass. It assumes a solid form, that of ice or snow, at 32° F. (0° C.); and it takes the form of vapor or steam at 212° F. (100° C.), under a pressure of 29.9 inches (more exactly, 760 millimeters) of mercury, retaining that form at all higher temperatures. Under ordinary conditions, therefore, water possesses the liquid form only at temperatures lying between 32° and 212° F. The specific gravity of water is 1 at 39.2° F. (4° C.), being the unit to which the specific gravities of all solids and liquids are referred; one cubic foot of water at 62° F. weighs about 1,000 ounces or 62.28 pounds. Water is 770 times heavier than atmospheric air at 32° F. (0° C.) and under a pressure of 760 millimeters. It has its greatest density at 39.2° F. (4° C.), and in this respect it presents a singular exception to the general law of expansion by heat. If water at 39.2° F. is cooled, it expands as it cools till reduced to 32°, when it solidifies; and if water at 39.2° F. is heated, it expands as the temperature increases in accordance with the general law. Considered from a chemical point of view, water is a compound substance, consisting of hydrogen and oxygen, in the proportion of 2 volumes of the former gas to 1 volume of the latter; or by weight it is composed of 2 parts of hydrogen united with 16 parts of oxygen. It exhibits in itself neither acid nor basic properties. Water enters, as a liquid, into a peculiar kind of combination with the greater number of all known substances. Of all liquids water is the most powerful and general solvent, and on this important property its use depends. Without water the processes of animal and vegetable life would come to a stand. The globe is covered on about $\frac{3}{4}$ of its surface by the ocean water, to an average depth of very nearly 12,500 feet. (See *ocean*.) This water is, however, far from pure, since it holds in solution nearly 3 per cent. of its weight of saline matter, about three fourths of which is common salt. The ocean water is not potable, but pure water can be obtained from it by distillation, as is often done at sea—for which purpose, however, fuel and a somewhat cumbersome apparatus are required. Some towns on the South American coast have been supplied with water exclusively in this way, up to the time when works were completed for bringing it from the distant mountains. The chief source of supply for the water which falls upon the earth is the ocean, from whose surface it is raised by the heat of the sun in the form of vapor, ready to be condensed again and fall as rain or snow either on sea or land, in accordance with varying and complicated conditions of climate and topography. The precipitation of rain and snow upon different parts of the earth's surface varies greatly, both in its total amount and in its seasonal distribution. Some regions receive as much as 600 inches in a year; over other extensive areas the rainfall is so small that it is hardly possible to measure it. In some districts the rain is pretty equally distributed through the year; in others it is all, or nearly all, limited to one season, as winter or summer. These climatic conditions are matters of the utmost importance, as regards both the distribution and the welfare of the human race and of animal and vegetable life in general. The habitability and fertility of the earth depend in part on temperature and in part on the amount and character of the precipitation. In general, where there is no rainfall the region is either very sparsely or not at all inhabited, and vegetation is almost entirely wanting; of this character is a considerable part of northern Africa and central Asia: such regions are called *deserts*. Other regions, where there is some rainfall, but where the amount is small, are destitute of forests but support a more or less abundant growth of grasses. Such regions are, as a rule, thinly inhabited, and the population is pastoral and nomadic; of this character are large areas in central Asia, and in both North and South America. Regions of abundant or even of moderately large precipitation are generally forested, and can be successfully cultivated after the forests have been cut down: these, in general, are the densely inhabited parts of the world. Such are the essential facts and conditions of the distribution of population as connected with rainfall. But to these are many exceptions. Thus, the Nile flows for 2,000 miles through a rainless region, but has a somewhat dense population for a considerable distance along its banks, though only there, the river itself being the sole source of water-supply for the inhabitants of the valley. Some regions of very small rainfall are situated sufficiently near high mountain-ranges on which the precipitation is comparatively large, and from which water can be obtained in considerable quantity with a moderate expenditure of money. In this connection the fact that the precipitation at high altitudes is chiefly in the form of snow is a matter of great importance, as thereby the supply of water is made capable of lasting through, or nearly through, the summer, the snow melting gradually, while the precipitation in the form of rain would be carried away much more rapidly. Rain, if caught at a distance from human habitations and after it has been falling for some time, contains hardly a perceptible trace of foreign matter. Snow falling in the polar regions is also very nearly chemically pure. By distillation, with suitable precautions, water may be obtained which will leave no trace of residue when evaporated in a platinum vessel, and which will also be free from gaseous contents. The water of springs and rivers always contains more or less mineral matter, which it has dissolved out from the soil and rock with which it has been in contact upon the surface or underground. Next to rain-water, the purest natural water is that of mountain-lakes fed from melting snow, and resting on crystalline and impermeable rocks; and rivers in uninhabited regions, running over similar rocks, are also very nearly pure, sometimes leaving not more than two or three grains of foreign matter to the gallon when evaporated to dryness. Rivers, on the other hand, which run over calcareous and soft shaly and clayey rocks always contain a considerable amount of impurities; from fifteen to twenty grains to the gallon is not an uncommon amount under such conditions. Pure water, such as that of mountain-lakes and rivers running over crystalline rocks, is called *soft*; water containing more than eight or ten grains of mineral matter to the gallon is called *hard*.

The foreign matter in soft water is partly organic and partly mineral; in the latter a little silica is always present, as well as salts of potash, soda, lime, and magnesia. The impurities of hard water are varied in character, but carbonate of lime generally predominates. The mineral impurities of water are not necessarily deleterious to health, even if present in somewhat large quantities. The contamination of water by organic matter (such as sewage, and the like) is a matter of great importance and often of great danger. Dead organic matter is rapidly oxidized by exposure to the air in flowing water, and ceases to be dangerous to health. The living organisms with which water is sometimes contaminated, in receiving the sewage of towns or in other ways, are sometimes the germs of deadly disease, and appear to possess a large amount of vitality, so that they can be conveyed for long distances without becoming disorganized, as is the case with dead organic matter. See *water-supply*.

2. A limited body of water, as an ocean, a sea, or a lake; often, in provincial English and Scotch use, a river or lake: as, Derwent Water (lake); Gala Water (stream). Gar warn the water, braid and wide.
Jamie Telfer (Child's Ballads, VI. 110).

The water, in the mountainous districts of Scotland, is often used to express the banks of the river, which are the only inhabitable parts of the country. To raise the water, therefore, was to alarm those who lived along its side.
Quoted in Child's Ballads, VI. 110, note.

The phrase "going to the waters" has been familiar to me for the last forty years as used by the peasantry in the counties of Huntingdon, Rutland, and Lincoln. By it is meant a seaside place, and not an inland watering-place, such as Malvern, Bath, Leamington, or Cheltenham.
N. and Q., 7th ser., VII. 378.

8. In finance, additional shares created by watering stock. See *water*, *v. t.*, 4.

Canterbury water, water tintured with the blood of Thomas Becket, Archbishop of Canterbury, who was murdered in 1170, and afterward canonized as a saint and martyr. See the quotation.

To satisfy these ravings, so as to hinder an uneasy feeling at the thought of tasting human blood, a tiny drop was mingled with a chalice-full of water, and in this manner given to those who begged a sip. High-water shrub, a shrubby composite plant, *Iva frutescens*, a native of the United States along the sea-coast from Massachusetts to Texas. Also called *marsh-elder*.—**Holy water**, water used for ritual purification of persons and things; especially, water blessed by a Christian priest, and used to sprinkle upon persons or things, or to sign one's self with at entering church. Holy or lustral water has been used in almost all religions in purification of persons and things, especially in preparation for worship, and also to drive away the powers of evil. Under the ancient Jewish law, the priests bathed their hands and feet in a laver before entering the tabernacle or approaching the altar (Ex. xxx. 17-21, xl. 30-32), and the "water of purification" (Num. viii. 7, xix. 9, etc.) presents another analogy to Christian usage. The use of holy water in the Christian church is very ancient. In the Roman Catholic Church holy water is prepared every Sunday by exorcism and benediction of salt, and exorcism and benediction of the water, after which the salt is cast in the water, and both again blessed together. In the Greek Church the use of a holy-water stoup (colymbion) at the entrance of a church is almost obsolete. Holy water is used in the houses, and is blessed on the first of the month in the phiale, and at the Epiphany there is a general blessing of water. See cut under *stoup*, 3.—**Holy-water clerk**, *sprinkler*, *stick*. See *holy*.—**Homburg water**, a chalybeate saline water from springs in Homburg near the Rhine: used in the treatment of dyspepsia and disorders of the liver, especially those that have been brought on by high living.—**Hot Springs waters**, calcic sulphur waters from a number of thermal springs in Hot Springs, Arkansas. They are largely employed in the treatment of syphilis, rheumatism, and chronic diseases of the skin and mucous membranes.—**House of water**. See *housel*.—**Hungary water**, a preparation of spirits of rosemary, used, especially during the eighteenth century, as a lotion, a perfume, or an internal remedy. The name is said to have been given to it in allusion to a queen of Hungary who tested the efficacy of the water in bathing.

All these ingredients mention'd are to be had at the Apothecaries, except the *Queen of Hungaries Water*, which is sold by Mich. Johnson, Bookseller in Leichfield. *The Hoop Sinner* (1691), quoted in N. and Q., 7th ser., [X. 115.]

water-gas (wá'tér-gás), *n.* A gas, non-luminous in its pure form, derived in part from the decomposition of steam. The apparatus for making it consists of a furnace for anthracite coal or other fuel, connected at the top with a tower filled with loose brick and called a *regenerator*. The products of combustion pass through the regenerator, and raise it to a white heat. Steam is then admitted below the furnace, and, passing upward through the fire and through the regenerator, is decomposed. While the steam is passing the furnace, either coal reduced to dust or crude naphtha is allowed to fall through the ascending steam over the fire. Complicated chemical reactions take place, the result being the formation of quantities of fixed gas. There are also other methods closely allied to this. By one process the non-luminous gas is afterward enriched by the addition of a hydrocarbon, as petroleum or naphtha. Water-gas is commonly thus treated, and used as an illuminating gas; but it is also used, in its non-luminous form, as a heating gas for cooking and other purposes.

2. A leveling-instrument in which water is employed instead of mercury or spirit of wine. It consists of a tin tube, about 3 feet long, bent at right angles at each end, with a small short tube soldered on it at its center, by the aid of which it can be fixed upon some kind of a support or tripod. In the bent ends of the long tube are inserted two small glass vials with their bottoms cut off. Enough water is then poured in to about half fill the bottles when the instrument is level. By sighting across the surface of the water a level-line is got. The extreme cheapness and portability of this level make it serviceable sometimes, although it gives but a rough approximation to accuracy as compared with the best kind of spirit-level.

The flowers have numerous petals of a delicate texture, forming when expanded nearly a hemisphere—white, blue, red, or yellow. Several white water-lilies are the most familiar. The common European species is *C. speciosa* (*N. alba*), with leaves 6 or 8 and flowers 3 or 4 inches in diameter. The ordinary American species is *C. (N.) odorata*, with very sweet-scented flowers often 5½ inches wide, and leaves 5 to 9 inches broad, varying in color to pinkish or even bright pink-red, especially at Barnstable, Massachusetts. In the interior United States is found *C. (N.) reniformis*, with considerably larger leaves and flowers, scentless or slightly apple-scented, and always white—the rootstock bearing numerous self-detaching tubers. The golden water-lily, *C. (N.) flava*, of Florida, which long escaped the notice of botanists, is a locally abundant species of moderate dimensions, with yellow flowers. *C. mystica* (*N. Lotus*), the specific Egyptian water-lily, with white, pink, or red flowers, and *C. sentifolia* (*N. cerulea*), the blue water-lily, also of Egypt, are named among the lotuses. *C. (N.) thersalis* is a rare species occurring in warm springs in Hungary, and called *Hungarian lotus*. The Australian water-lily, *C. (N.) gigantea*, has the leaves in the larger specimens 18 inches broad, the flowers a foot broad with over 200 stamens, the petals blue, purple, pink, or rarely white. S. Bowles, *Our New West*, p. 50.

2. A spout, jet, or column of water; specifically, a whirlwind over a body of water, producing the appearance of a solid column of water extending from the surface to the clouds. In reality, however, the phenomenon that is seen is the cloud brought down to the earth's surface by the rapid gyratory motion of a vertical whirl, and it consists simply of fine mist surrounding a central axis of rarefaction. At first the cloud has the form of a tapering funnel; then, descending to near the water's surface, it draws up the water for a distance into its vortex, and imparts to it its whirling motion. The spout is then complete, and appears as an immense column connecting sea and cloud, light in color near the center, but dark along the sides. Like other whirlwinds, the waterspout has a progressive as well as a rotary motion, its axis sometimes being inclined forward in the direction of advance. After continuing a short time, generally less than twenty minutes, the column is disintegrated, the lower part descending as rain, while the upper part is drawn back into the clouds. The height of the spout depends upon the hygrometric state of the air; in general it is between 800 and 2,500 feet. It is common for a number of waterspouts to be seen simultaneously or successively; and this is to be expected, for a series of separate and independent gyrations are likely to arise when the air is in a state of instability, such as is required for the development of these whirlwinds. This is especially the case in tropical and equatorial regions, where waterspouts are most frequent.

Deep calleth unto deep at the noise of thy *waterspouts*.
Ps. xlii. 7.

water-supply (wá'tér-su-plí'), *n.* The obtaining of water for and its distribution to a town or city, as far as possible in sufficient quantity and of satisfactory quality; also, the amount of water thus provided and distributed. *Water-supply*, as this term is generally used, differs from *irrigation* in that the latter has to do with providing and distributing water for agricultural purposes—that is, it is an attempt to make up for a deficiency of, or for irregularity in, the natural rainfall. *Water-supply*, on the other hand, is the providing of water for domestic and manufacturing uses in sufficient quantity, and under favorable conditions, not only as to purity, but also as to pressure, so that it may be available without the necessity of carrying it by hand to the upper stories of houses or manufactories, and as to storage, so that large quantities can be used within a short period of time, as when needed for extinguishing extensive conflagrations in cities. The question of *water-supply* is one which has to do, and to a most important extent, with the health, comfort, and material well-being of all localities, even where there is only a moderately dense aggregation of population; and the larger and denser such aggregation the more important this question becomes. The natural source of *water-supply* is the rain, and this is one of great importance in regions of considerable rainfall and of thinly aggregated population, the water being caught on the roofs of the houses or barns and conveyed to cisterns where it is stored for use as wanted, and from which it has to be pumped. Almost everywhere in regions of considerable precipitation water can be had by digging shallow wells in the surface detritus, and this is an extremely common mode of supply in agricultural districts, the advantage being that the expense of digging a well is much less than that of providing storage in cisterns, while the disadvantage is that well-water is ordinarily not so pure as rain-water (and this is emphatically the case in limestone districts). Besides, it is almost impossible to provide cisterns large enough to hold the amount of rain-water required during periods of abnormally long drought, such as occasionally occur even in regions of considerable average rainfall. These sources of supply—namely, rain caught as it falls and water from shallow wells—are entirely unsuited to the conditions in towns of even moderate size. The rainfall in cities is contaminated with soot and gases thrown out from the many chimneys of houses and manufacturing establishments; neither is it large enough in quantity, nor can it be stored satisfactorily without incurring an expense far greater than would be that of providing a supply in some other way. Rivers would seem to be the natural source of supply for cities situated upon them, and there are few very large cities through which a river does not run; but rivers are the natural and almost necessary sewers of the cities drained by them, and the water, thus polluted, is not only often disagreeable to the taste, but is always a possible source of danger to health. It is true that some cities of moderate size situated on very large rivers do but their water, as, for instance, St. Louis on the Mississippi; but, in general, if a river is used, the water must be taken from a point high enough up-stream to avoid the risk of contamination from the sewage of the towns situated on or near its banks, as is done in London, which is largely supplied by water from the Thames drawn from a point far above the city. The most satisfactory source of *water-supply* for a city is a mountain-lake, not too far distant, where the geological and other conditions are such as to insure a high degree of purity in the water. This is emphatically the case with regard to Glasgow, which is supplied from Loch Katrine. Much oftener *water-supply* in quality and abundant in quantity can be obtained by creating one or more artificial lakes at the head of a suitably situated river by the construction of dams; these are sometimes of great height, holding back bodies of water miles in length. Of this character is the *water-supply* of Liverpool, of New York, of Boston, and of many other important cities. Regions underlain by thick masses of permeable rocks—as, for instance, the New Red Sandstone and Chalk districts of England—are not infrequently supplied with water by means of wells bored to considerable depths and of large dimensions, from which the water sometimes rises to the surface, but more often has to be pumped. Many large towns in the manufacturing districts of England were formerly almost exclusively, and are still to some extent, supplied in this way; but wherever it has been found possible to obtain water in some better way this system has been abandoned, neither quality nor quantity being satisfactory. Considerable water is procured in England from deep wells in the Chalk, and this method of supply is of some importance in London. Where the conditions are such that pure water cannot be had, artificial purification is sometimes resorted to, but this is always expensive and often unsatisfactory. An abundant supply of soft water, taken from some source known to be free from the possibility of contamination by sewage or otherwise, is one of the greatest of blessings, and this result has been attained in various cities, but not without large expenditure and no small amount of engineering skill. The distribution of water was once a matter of considerable difficulty, the wooden pipes first employed being subject to rot and leakage. In modern times the use of cast-iron for the mains is most common, while the service-pipes are usually of lead or galvanized iron, but sometimes of bronze or brass.

wave¹ (wāv), *n.* [*ME.* **wave*, *wawe*; *< ware*, *r.* The word *wave* in its most common sense has taken the place, in literary use, of the diff. noun *waw*, *wawe*, a wave. The form *wave* could not, however, change into *wave*: see *wave*¹. The noun *wave*, as well as the verb, has been confused with *wave*¹.] 1. A disturbance of the surface of a body in the form of a ridge and trough, propagated by forces tending to restore the surface to its figure of equilibrium, the particles not advancing with the wave.

No ship yit karf the *waves* grene and blew.

Chaucer, Former Age, I. 21.

When you do dance, I wish you
A *wave* o' the sea, that you might ever do
Nothing but that.

Shak., W. T., iv. 4. 141.

2. Water; a stream; the sea. [*Poetical.*]

Byron, The Giaour.

3. A form assumed by parts of a body which are out of equilibrium, such that as fast as the particles return they are replaced by others moving into neighboring positions of stress, so that the whole disturbance is continually propagated into new parts of the body while preserving more or less perfectly the same shape and other characters. In a somewhat wider sense the word is applied in cases where there is no progression through the body; thus, the shape of a vibrating piano-string may be called a *wave*. But in its narrowest and most proper sense it is restricted to an advancing elevation or depression of the surface of a body. An advancing elevation is called a *positive wave*, a depression a *negative wave*. Waves on the surfaces of liquids are distinguished into four orders. A wave of the first order, also called a *wave of translation*, leaves the particles, after its passage, shifted in the line of its motion. It is also called a *solitary wave*, because a single impulse produces but one elevation or depression, which has no definite length, but extends over the whole surface. The negative wave of this sort shortly breaks; it is only the positive wave, which leaves the particles in advance of their initial positions, which can be propagated far. This wave is also called *Scott Russell's great wave*, because it was first discovered by that engineer in 1834, and because, owing to its form, it cannot be seen unless it is very high.

The velocity of such a wave is equal to $\sqrt{g(h+k)}$, where g is the acceleration of gravity, h the depth of the liquid in repose, and k the height of the crest of the wave above the plane of repose. This wave dies down of itself in a canal of uniform depth, independently of friction, and when it passes into shallow water it breaks as soon as h is no greater than k . A canal-boat produces such a wave, and consequently can be propelled at the rate of speed of the wave far more economically than at any other. In waves of the second order, called *oscillatory waves*, observation shows that each particle describes at a uniform rate of motion a circle in a vertical plane; but according to theory other orbits are possible. The particle at the crest of the wave is at the highest part of its path, that in the trough at the lowest. As long as the momentum of the particles is kept up, wave must succeed wave. If the water has a flow opposite to the direction of propagation of the waves and equal to it in velocity, it is plain that each particle will describe a prolate cycloid, and this is consequently the form of the waves. Waves thus brought to a standstill by the flow of the water are called *standing waves*. (See fig. 1.) They are often seen in rapidly running water.

Fig. 1. Standing waves in a torrent.

If the motion of the liquid is irrotational, theory shows that the waves cannot be cycloidal. But in regard to this whole subject neither theory nor observation can be trusted implicitly to give the truth of nature. The velocity of propagation of oscillatory waves, at least in deep water, is represented by the expression $\sqrt{gA/2\pi}$, where A is the length of the wave from crest to crest. But the velocity of propagation of a group of waves is much slower. Oscillatory waves break on a shelving shore when their height is about equal to the depth of the water, and from each one, as it breaks, a wave of the first order is produced. (See fig. 2.) Waves of the third order, called *ripples*, are distinguished from those of the second order in the fact that the shorter they are the more rapidly they move.

While an oscillatory wave 32 inches long will advance 3 feet per second, and one of 3 inches long only 1 foot per second, a ripple a quarter of an inch long will move 1 foot per second, a ripple an eighth of an inch long will

Fig. 2. Oscillatory waves rolling in and breaking upon the shore, and giving rise to a series of waves of translation.

move $\frac{1}{8}$ feet per second, and so on. The reason is that the force of restoration of the particles is here not chiefly gravity, but the surface-tension of the liquid. Ripples very rapidly die out. Waves of the fourth order are *sound-waves*. They are propagated in water at the rate of about 1,580 yards per second—that is, at a much greater speed than that of sound in air. In the case of sound propagated in the air, the waves are formed by the alternate forward and back motion of the air-particles in the direction in which the sound is being propagated; the waves are consequently waves of condensation and rarefaction, having in the free air a spherical form. The amplitude of vibration or excursion of each particle is very small, but the wave length is large—for the middle C of the keyboard, about $\frac{1}{4}$ feet. A sound-wave travels in air about 1,100 feet per second. (See further under *sound*.) In the case of radiant energy (heat and light) propagated through the ether, the ether-particles vibrate transversely to the line of propagation; here the wave-length is very small—for violet light, about 0.000,016 of an inch, for red about twice this length, while the *dark heat-waves*, though much longer, are still very minute (see *spectrum*). A *light-wave* (or, more generally, an *ether-wave*) travels in space about 185,000 miles per second. Hertz has shown recently (1887) that by a very rapid oscillating electrical discharge, as between two knobs, a disturbance is produced in the surrounding ether which is propagated as *electric waves* with a velocity like that of light. These electric waves in Hertz's experiments were found to have a wave-length of upward of one meter. They are reflected from the surface of a conductor, but are transmitted by a non-conductor, as pitch, and may be brought to a focus; they may be made to interfere, then forming nodal points, and by passage through a grating of parallel wires they may be polarized. These electric waves are hence in all essential respects like light-waves, but differ in their relatively enormous length and the corresponding slowness of the oscillations. These experiments of Hertz form a most important confirmation of the electromagnetic theory of light proposed by Maxwell (see *light*).

That which in *waves* of fluid is rest is in *waves* of sound silence, and in *waves* of light darkness.

Lommel, Light (trans.), p. 220.

The reason why one end of the coloured band (spectrum) . . . is red and the other blue is that in light as in sound we have a system of disturbances or *waves*; we have long *waves* and short *waves*, and what the low notes are to music the blue *waves* are to light.

J. N. Lockyer, Spect. Anal., p. 34.

4. One of a series of curves in a waving line, or of ridges in a furrowed surface; an undulation; a swell.

Dogs of Great Britain and America, p. 107.

5. Figuratively, a flood, influx, or rush of anything, marked by unusual volume, extent, uprising, etc., and thus contrasted with preceding and following periods of the opposite character; something that swells like a sea-wave at recurring intervals; often, a period of intensity, activity, or important results: as, a *wave* of religious enthusiasm; *waves* of prosperity.

A light wind blew from the gates of the sun,
And *waves* of shadow went over the wheat.

Tennyson, The Poet's Song.

An emotional *wave* once roused tends to continue for a certain length of time. *A. Bain*, Emotions and Will, p. 32.

Specifically—6. In *meteor.*, a progressive oscillation of atmospheric pressure or temperature, or an advancing movement of large extent in which these are considerably above or below the normal: as, an air-*wave*, barometric *wave*, cold *wave*, warm *wave*, etc. The term *barometric wave* is often restricted to those changes in atmospheric pressure which are not connected with cyclonic disturbances nor with the regular diurnal variation, but which include progressive oscillations of a varied character and origin, ranging from those of a short wave-length, which occupy but a fraction of a minute in their passage, to those which cover thousands of miles and occupy several days in their development and subsidence. The remarkable air-waves generated by the eruption of Krakatoa are shown by barographic traces to have had an initial velocity of 700 miles an hour, and to have traveled round the earth not less than seven times.

7. A waved or wavy line of color or texture; an undulation; specifically, the undulating line or streak of luster on cloth watered and calendered.—8. A waving; a gesture, or a signal given by waving.

Stand dark round thy green grave.

O. W. Holmes, Old Vol. of Life, p. 53.

9. A book-name of certain geometrid moths. Thus, *Acidalia rubricata* is the tawny wave; *A. contigularia* is Greening's wave; *Venusia canbraria* is the Welsh wave, etc.—**Barometric wave**. See def. 6.—**Cold wave**, a progressive movement of an area of relatively low temperature. It is preceded by an area of low pressure, and is, in the United States, directly associated with the north-westerly winds which follow a cyclonic depression and accompany the advance of an area of high barometer. The cold wave is, in the United States, in most cases an out-pour of cold dry air from the barren plains of British America, where the air is cooled during the long nights of winter to a very low temperature. In Texas and the Gulf of Mexico the cold wave is termed a *norther*. The approach of cold waves is made a subject of forecast by the United States Weather Bureau. (See under *signal*.) A decided fall of temperature of less extent, such as frequently occurs in other than winter months, is termed a *cool wave*. [U. S.]

When the fall of temperature in twenty-four hours is twenty degrees or more, and covers an area of at least fifty thousand square miles, and the temperature in any part of the area goes as low as 36°, it is called a *cold-wave*.
Amer. Jour. Sci., 3d ser., XL. 463.

Dicrotic wave. See *dicrotic*.—**Hot wave**, **warm wave**, a progressive movement, generally eastward, of an area of relatively high temperature, but without so definite a boundary and character as distinguish a cold wave. The general conditions of a warm wave, or heated term, in summer are pressure decreasing to the northward, southerly winds, fair or hazy weather, with practically unbroken isolation, and, in some cases, such an amount of vapor in the air as to diminish the usual nocturnal radiation. [U. S.]—**Length of a wave**, or **wave-length**, the distance between any two particles which are in the same phase.—**Period of a wave**, the time between the passage of successive crests, or between successive extreme displacements of a particle in the same manner.—**Predicrotic wave**. See *predicrotic*.—**Smoky wave**. See *smoky*.—**Storm-wave**. (a) A sea-wave raised at the center of a cyclonic storm by the low atmospheric pressure and the force of the winds. It advances with the progressive motion of the storm, and has all the properties of a true wave. When augmented by a heavy fall of rain, and blown by strong winds upon a low shore, the storm-wave causes disastrous inundations. The thickly populated low-lands at the head of the Bay of Bengal have been the scene of frequent storm-floods, occasioning enormous losses of life and property. (b) In general, on sea-coasts, the increased wave-motion accompanying storms.—**Subangled wave**, a British geometrid moth, *Acidalia strigularia*.—**Tidal wave**. See *tidal*.—**Type of a wave**. See *type*.—**Warm wave**. See *hot wave*, above.—**Wave of contraction**, in *physiol.*, visible muscular contraction as propagated from a point where the muscle itself is stimulated.—**Wave of stimulation**, in *physiol.*, the motor influence of a nerve, supposed to be transmitted by molecular undulation.

I shall always speak of muscle-fibres as conveying a visible wave of contraction, and of nerve-fibres as conveying an invisible, or molecular, *wave of stimulation*.
G. J. Romanes, Jelly Fish, etc., p. 25.

Wave of translation. See def. 3. (See also *brain-wave*, *pulse-wave*.)—**Syn. 1.** *Wave*, *Billow*, *Surge*, *Breker*, *Surf*, *Swell*, *Ripple*. *Wave* is the general word. A *billow* is a great round and rolling *wave*. *Surge* is only a somewhat stronger word for *billow*. A *breaker* is a wave breaking or about to break upon the shore or upon rocks. *Surf* is the collective name for *breakers*: as, to bathe in the *surf*; it is sometimes popularly used for the foam at the edge or crest of the breaker. *Swell* is the name for the fact of the rising (and falling) of water, especially after the wind has subsided, or for the water that so rises (and falls), or for any particular and occasional disturbance of water by such rising (and falling): as, the boat was swamped by the *swell* from the steamer. *Ripple* is the name for the smallest kind of *wave*.

The high water walls came rolling in, and at their highest tumbled into *surf*. . . . Some white-headed *billows* thundered on. . . . The *breakers* rose, and, looking over one another, bore one another down, and rolled in, in interminable hosts. . . . The sea . . . carried men, spars, . . . into the boiling *surge*.

As the carriage returns, this strip of ink is distributed on the inking table by rollers placed diagonally across the machine. The diagonal position gives them a *wavering* motion; hence they are called *wavers*.

If upon every central section of a quadric surface be erected a perpendicular at the center, and points be taken on this perpendicular at distances from the center equal to the axes of the section, then the locus of these points will be the wave-surface. It is frequently called *Frenel's wave-surface*, to distinguish it from *Huygen's wave-surface*, which is simply an ellipsoid—the latter being the form of the wave-front of a uniaxial crystal, the former that of a biaxial crystal.—**Malus's wave-surface** (discovered by E. A thick, sticky substance secreted by bees, and used to build their cells; the material of honeycomb; beeswax. In its

natural state it is of a dull-yellow color, and smells of honey. Its consistency varies with the temperature; it is ordinarily a pliable solid, readily melted. When purified and bleached, it becomes translucent white, is less tenacious, without taste or smell, and of a specific gravity a little less than that of water. It softens at 80° F., becoming extremely plastic, and retaining any form in which it may be molded, like clay or putty, and melts at 158° F. In chemical composition, wax consists of variable proportions of three substances, called *myricin*, *cerolein*, and *cerotic acid*. Wax is used for many purposes, both in its natural state and variously prepared. As bleached, and also then variously tinted, it is made into wax candles, which give a peculiarly soft light. In pharmacy it enters into the composition of various plasters, ointments, and cerates, as a vehicle for the active ingredients, and to confer upon the preparation a desired consistency. It has varied uses in the plastic arts, especially in the making of anatomical models, artificial flowers and fruits, casts and impressions of various kinds, etc.

This pardoner hadde heer as yelow as wax.

2. One of various substances and products resembling beeswax in appearance, consistency, plasticity, and the like, or used for like purposes. (a) The substance worked up from the pollen of flowers by the hind legs of bees, and used to feed their larvae; bee-bread, formerly supposed to be beeswax. (b) The substance secreted by various coccids or wax-scales, especially such as has commercial value. (See *wax-insect*, 1.) (c) The product of some other homopterous insects. (See *wax-insect*, 2.) This is more or less stringy and flocculent, and approaches in character the froth or spume of the spittle insects, but in some cases is usable like beeswax. (d) The secretion of the sebaceous glands of the outer ear; cerumen; ear-wax. (e) A vegetable product which may be regarded as a concrete fixed oil, the principal varieties being Chinese wax, cow-tree wax, carnauba wax, and Japan wax. It may be obtained from the pollen of many flowers, and it forms a part of the green fecula of many plants, particularly of the cabbage. It appears as a varnish upon the fruit or the upper surface of the leaves of many trees, as the wax-palm and wax-myrtle. Also called *vegetable wax*. See *cut* under *Myrica*. See also *wax-tree*, and compounds below. (f) A mineral product, one of certain fossil hydrocarbons which occur in small quantities generally in the Carboniferous formation: called more fully *mineral wax*. The most familiarly known variety is *cozerite*. (g) A substance used for sealing. See *sealing-wax*.

The Java sparrow is a good example. (See *cut* under *sparrow*.) The original waxbill, first so named by Edwards in 1751, the waxbill grosbeak of Latham (1783), *Loxia astrild* of Linnæus, and now *Estrelida astrilda*, or *Estrelida astrild*, or *Estrelida astrilda* (for the name thus wavers in spelling), is a South African bird, ranging as far as Matsbeland on the east and Damaraland on the west coast. It furnishes most of the white wax of commerce, specified as *Chinese wax* and *pela*. This insect, a native of China, occurs upon plants of the genera *Rhus*, *Ligustrum*, *Hibiscus*, *Celastrus*, etc. The wax is said to be mainly secreted by the male. It is collected from the plants on which it is deposited, melted and clarified, and made into a very high class of candles used in China. It has been imported in England for the same purpose, but is too expensive for general use. (b) Any member of the genus *Ceroplastes*. Send its rough *wayward* roots in all directions. *Smithson, Useful Book for Farmers*, p. 32. (*Encyc. Dict.*) = *syn.* *Wayward, Wilful, Contrary, Untoward*, headstrong, intractable, unruly. The italicized words tend toward the same meaning by different ways. *Wayward*, by derivation, applies to one who turns *away* from what he is desired or expected to be or to do; but, from its seeming derivation, it has come to apply more often to one who turns toward *ways* that suit himself, whether or not they happen to be what others desire. *Wilful* suggests that

the person is full of self-will, which asserts itself against those whose wishes ought to be deferred to or whose commands should be obeyed. *Contrary* and *untoward* express the same idea, the one in a positive, the other in a negative form. *Contrary* is an energetic word, expressing the idea that one takes, or is disposed to take, the course exactly opposite to that which he is expected or desired to take. *Contrariness*, when ingrained, becomes perverseness: as, a *contrary* disposition; a *contrary* fellow. This use of *contrary* is by many considered colloquial, but has the recommendation of figurative force. *Contrary* and *untoward* view the person as one to be managed; *untoward* views the person also as the object of mental or moral discipline: this perhaps through its use in Acts ii. 40. An *untoward* person is not responsive to persuasion, advice, influence, or requests; *untoward* circumstances are similarly such as do not help us in our plans. All these words imply that the only consistency in the person's conduct is in this self-willed independence of others' wishes or opposition to them, but *untoward* implies it least. See *perverse*.

We is sometimes, like *they*, vaguely used for society, people in general, the world, etc.; but when the speaker or writer uses *we* he identifies himself more or less directly with the statement; when he uses *they* he implies no such identification. The French and German sovereigns followed the example about the beginning of the thirteenth century.

Weald (wĕld), *n.* [*< late ME. weald*, appar. an irreg. form of *wild* (formerly pron. *wild*), early mod. E. *wilde*, *wylde*, found in same sense, confused by later writers with ME. *wald*, *wold*, *wæld*, *< AS. wald*, a forest: see *wold*¹. The proper E. form of AS. *wald* is *wald* (parallel with *bold*, *fold*, *hold*, *sold*, *told*, etc.). The mod. spelling *weald* represents the earlier *wæld*, and has nothing to do with AS. *wæld*, unless it is due to Verstegan, who affected the "restitution" of old forms.] *1.* The name given in England to an oval-shaped area, bounded by a line topographically well marked by an escarpment of the Chalk, which begins at Folkestone Hill, near the Straits of Dover, and passes through the counties of Kent, Surrey, Hants, and Sussex, meeting the sea again at Beachy Head. It embraces the southwestern part of Kent, the southern part of Surrey, the north and northeastern half of Sussex, and a small part of the eastern side of Hampshire. These are the limits of the area now known to geologists as the *Weald*; but, according to the English Geological Survey, it is probable that the area anciently designated by that name was somewhat smaller than this, having been bounded by the escarpment of the Lower Greensand, which is approximately concentric with that of the Chalk, but inside and distant from five to ten miles from it. This latter escarpment is, however, in places rather ill-defined, so that there the boundary of the ancient *Weald* was doubtful. The geology of the *Weald* is extremely interesting, hence the name has become very familiar. The formations covering the *Weald* proper are known as the *Wealden* (which see). The *Weald* was originally partly covered with forests and partly destitute of them.

The Historie of this Hogheard, presenteth to my minde an opinion, that some men mainteine touching this *Weald*: which is that it was a great while together in manner nothing els but a desert, and waste wilderness, not planted with Townes, or peopled with men, as the outsides of the shyre were, but stored and stuffed with heards of Deere, and droves of Hogs only. Which conceit, though happily it may seem to many but a Paradoxe, yet in mine owne fantasie, it watech not the fecte of sound reason to stand upon.

We know that the *Weald* proper, or that part of the country below the Lower Greensand escarpment, was the part latest cultivated. Even as late as Elizabeth's time swine are said to have run wild here.

A small carnivorous digitigrade mammal of the restricted genus *Putorius*, of

the family *Mustelidæ*, related to the stoat or ermine, ferret, and polecat of the same genus, and less intimately to the marten or sable of the genus *Mustela* of the same family. The species to which the name is most frequently or especially applied is *P. vulgaris*, the common weasel of Europe and of most of the cold and temperate parts of the northern hemisphere, distinguished by the comparative length and extreme slenderness of the body, and very small size, being only some 6 or 8 inches long, with a tail of 2 inches in length, or less; the color is reddish-brown above, and white below; the tail is of the same color as the body, and not tipped with black. In northerly regions it turns white in winter, like the ermine. It feeds on rats, mice, moles, shrews, small birds and their eggs, and insects; and, though itself classed as vermin by gamekeepers, it is often serviceable as a destroyer of vermin in ricks, barns, and granaries, its small size and lithe, sinuous body enabling it to penetrate almost everywhere. Its cunning and wariness are proverbial in the expression to *catch a weasel asleep*—that is, to do an extremely difficult thing by strategy, finesse, or unexpected action. Other species of *Putorius*, properly called *weasels*, inhabit most parts of the world, and the name has loosely attached to various animals of different families, some of which applications are noted in phrases below.

Browne was *Mustela variegata*. The same adjective with the same meaning occurs in *Turdus mustelinus*, the present name of the wood-thrush of the United States, and in several other specific designations of animals, as in *Lepilemur mustelinus*, the weasel-lemur.  2.—4. The state of the air or atmosphere with
 respect to its cloudiness, humidity, motions,
 pressure, temperature, electrical condition, or
 any other meteorological phenomena; the at-
 mospheric conditions prevailing at any moment
 over any region of the earth: as, warm or cold
wether; wet or dry *wether*; calm or stormy
wether; fair or foul *wether*; cloudy or hazy
wether. The investigation of the various causes which
 determine the state of the atmosphere and produce the
 changes which are incessantly taking place in its con-
 dition forms the subject of meteorology. The average con-
 dition of the weather for a considerable period constitutes
 climate, and the statistical compilation of meteorological
 observations forms the basis of climatology.

Hakluyt's Voyages, III. 515.

2. In *geol.*, etc., the action of the elements in changing the color, texture, or composition of rock, in rounding off its edges, or gradually disintegrating it. The first effect of the weathering

of rock-surfaces is discoloration. This arises in part from dust or dirt finding its way into the fissures, and is most quickly seen in large cities where much coal is burned. Discoloration often arises from the oxidation of some sulphur compound which the rock contains, and especially of iron pyrites, which is a widely disseminated mineral. Another very perceptible effect of weathering is the loss of the luster which many rock-constituents naturally have. This is particularly conspicuous in the case of feldspar, and is the result of incipient decomposition and hydration. Rounding of the edges of angular projections of the rock, or of its constituents, is another result of weathering, the decomposed minerals being more easily removed by the action of water than they were before decomposition. Weathering is a preliminary to erosion, but the rapidity with which these operations are carried on varies greatly with the nature of the rock and the climatic and other conditions to which it is subjected.

Many of them [modules of various kinds] are, also, externally marked in the same direction with parallel ridges and furrows, which have not been produced by *weathering*.

Darwin, Geol. Observations, i. 78.

3. In *arch.*, a slight inclination given to an approximately horizontal surface to enable it to throw off water.

weather-map (weTH'ér-map), *n.* A map showing the temperature, pressure, wind, weather, and other meteorological elements over an extensive region, compiled from simultaneous observations at a large number of stations. The pressure is represented by isobars, the temperature by isotherms, the wind by arrows, and the weather by differently shaded circles or other conventional symbols. Weather-maps, prepared once or twice daily, form the basis upon which every government weather-service forecasts the weather and issues storm-warnings.

weather-plant (weTH'ér-plant), *n.* The Indian licorice, *Abrus precatorius*: so named in view of an alleged property of indicating the weather in advance. It is a common tropical twining shrub (see *Abrus*), having pinnate leaves with from 20 to 40 small leaflets. Recent careful observations show that the pairs of leaflets fold together more or less as the light is stronger or weaker, the movement being less vigorous in a moister atmosphere; that a certain wrinkling of the surface coexists with a coloring of the margin likely to be due to the attacks of an insect; and that the movement of the rachis, supposed to be barometric, is a diurnal oscillation which varies in extent with the amount of light. The temperature also affects the freedom of those motions. These characteristics are all paralleled in other plants, especially of the *Leguminosæ*. As a means of forecasting, the plant is not likely to be of practical worth.

weather-proof (weTH'ér-prōf), *a.* Proof against rough weather.

Lord, thou hast given me a cell
Wherein to dwell,
A little house, whose humble roof
Is *weather-proof*.
Herrick, A Thanksgiving to God for his House.

Who that has read Greek does not know the humour with which the meteorological theories of the Athenian *weather-prophets* are ridiculed by Aristophanes in "The Clouds"?

R. H. Scott, in Modern Meteorology, p. 166.

2. Anything in nature which serves as an indicator of weather changes, as a bird whose regular periodicity of migration or suddenness of appearance may indicate meteorological changes inappreciable by man.

Coxes, Birds of the Colorado Valley (1878), I. 372.

3. A device for foretelling changes in the weather. In most forms materials are employed which are so affected by dampness as to move some indicator, as a pair of figures, of which one appears or advances in dry and the other in wet weather. Other forms employ materials which change color according to the state of the atmosphere. Compare *weather-box*.

weather-report (weTH'ér-rē-pōrt'), *n.* A daily report of meteorological observations and of probable changes in the weather, especially one issued by a weather-service. [Colloq.]

weather-roll (weTH'ér-rōl), *n.* The roll of a ship to windward, in a heavy sea on the beam: opposed to *lee lurch*.

All the principal governments of the world now maintain a weather-service, upon which a part or all of these duties are imposed. In the United States an annual appropriation of nearly a million dollars is made to the Weather Bureau of the Department of Agriculture, which is charged with performing these services. In addition to the Weather Bureau, and cooperating with it, there is organized in nearly every State a State weather-service, composed of voluntary observers whose work is directed toward giving information upon the condition of the crops as affected by the weather, and in general toward extending knowledge of local climatology.

Weavers also of wolne and lynn. Quoted in *Destruction of Troy* (E. E. T. S.), Pref., p. xlvii.

Weavers were supposed to be generally good singers. Their trade being sedentary, they had an opportunity of practising, and sometimes in parts, while they were at work. Warburton adds that many of the *weavers* in Queen Elizabeth's days were *Flamish Calvinists*, who fled from the persecution of the Duke of Alva, and were therefore particularly given to singing psalms. . . . Hence the exclamation of Falstaff, "I would I were a weaver! I could sing psalms, and all manner of songs." *Nares.*

weaver-bird (wɛv'ɛr-bɛrd), *n.* One of numerous Old World (chiefly African and Indian) coriostrial passerine birds, noted for the dexterity and ingenuity with which they weave the materials of their nests into a textile fabric, and also for the extraordinary size and unusual shape of some of these structures. The name *weaver-bird*, in its present broad sense, is modern, and appears to have originally specified a single species (see below). In the last and early in the present century the birds of this group which were then known were classed with the finches and grosbeaks, sometimes with the orioles, mainly according to the thickness of the bill, and some of them received still more misleading names. Though there was an *Oriolus texor* in 1788, the genus *Ploceus* was not named till 1817, and the family *Ploceidae* not till 1847. With the recognition of this large and varied group, as well marked from the *Fringillidae* by the possession of 10 instead of 9 primaries, an English name became a desideratum, and *weavers*, *weaver-birds*, or *weaver-finches* became synonymous with *Ploceidae*, without implying that all the birds so named build very elaborate nests. (See *Ploceus, Ploceidae*.) Two remarkable types of nest may be noted. One is the hive-nest of the republicans or sociable weavers, many pairs of which build in common an enormous domed structure. (See *Philetetus*, and *cut* under *hive-nest*.) The other, the usual type of nest, is pensile or pendulous, and very closely woven, like that of the American hang-nests, but more elaborate, and with a hole in one side instead of being open at the top, in this respect resembling the nests of various titmice (bush-tits

and bottle-tits) and some wrens. These nests are generally slung at the ends of long, slender, drooping branches, often over the water of a pool or stream, where they are safest from monkeys and snakes. In some cases the males build additional nests for themselves, in which no eggs are to be laid—a habit, however, not confined to weaver-birds (see *cock-nest*). One of the largest, most characteristic, and best-known genera of weaver-birds is that African form called *Oryz* (a preoccupied name) by Lesson in 1831, and *Pyromelana* by Bonaparte in that year, though oftener called *Euplectes* (Swainson, 1837). There are 12 or 15 species, the characteristic coloration of which is black set off with scarlet or orange in large massed areas. *P. oryz*, the male of which is scarlet and black, is about 5 inches long; it was originally described by Edwards in 1751 as "the grenadier," from some fancied likeness of its plumage to a soldier's uniform. It inhabits South Africa. *P. aurea* of western Africa is the golden-backed finch and gold-backed grosbeak of the early ornithologists, being one of the yellow and black species. *P. capensis*, the Cape grosbeak of Latham, is another, from Cape Colony. *P. laha*, sometimes known as the *Mahali weaver*, and generally called *Ploceus* or *Euplectes taha*, is very small (scarcely 4½ inches long), of rich golden-yellow and velvety-black hues, and its nest is disproportionately large. It belongs to an extensive region of southeastern Africa. (See *cut* under *taha*.) Several other African weavers represent the genus *Ploceipasser*, as *P. mahali*. There is a large series of small birds, all technically weavers (*Ploceidae*), which fall in the spermestine division of the family, and belong to numerous genera of the Ethiopian, Oriental, and even the Australian region, as various amadavats, waxbills, strawberry-finches, blood-finches, senegals, etc. (See *Vidua* (a), and *cut* under *Ploceus, Senegal, Tenopygia*, and *waxbill*.) The birds of an extensive Oriental and Australian genus *Munia* (with its subdivisions, as *Padda*) belong here. (See *cut* under *sparrow*.) Fifteen species of *Uroloncha*, characterized by exerted middle tail-feathers, range from Africa to New Guinea; one of them is *U. acuticauda*. The genus *Erythrura* is another large one, reaching from India through much of Polynesia. None of the foregoing birds falls in the subfamily *Ploceinae* as now restricted. Among the latter may be noted the species of the African genus *Sitta-gra*, 6 in number, of which the best-known is *S. capensis* of Cape Colony, the olive oriole of Latham, commonly

Weaver-bird (*Sitagra capensis*).

called *yellow-crowned weaver* and *Ploceus icterocephalus*. This is 7 inches long, of an olive and golden-yellow and black color; it builds a large bottle-shaped or kidney-formed pensile nest. *Foudia* is a Madagascar type. The most extensive genus of all is the African *Hyphantornis*, with over 80 species, or the golden weavers, as *H. galbula*. These birds represent in Africa, or may be compared with, the hang-nest orioles of America. One of the longest- and best-known is *H. cucullatus* of western Af-

Weaver-bird (*Hyphantornis texor*).

rica, from Senegambia to the Gaboon; it has oftener been called *H. texor* (after *Oriolus texor* of Gmelin, 1788), and enjoys the distinction of being one of the first, if not the first, to which the name *weaver* attached, being the *weaver oriole* of Latham (1782); it is 6 inches long, yellow and black. *Malimbus* is an African genus of black and crimson, scarlet, vermilion, or yellow coloration, as *M. cristatus*. The African genus *Texor* (one of the early names—Temminck, 1828) has 2 marked species, *T. albicostis* (or *alecto*), the white-billed, and *T. erythrorhynchus* (or *niger*), the red-billed. (See *cut* under *Texor*.) Finally, the genus *Ploceus* itself as now restricted is an Oriental type of a few species, commonly called *baya-birds*, though it used to be indiscriminately applied to any of the foregoing, and became the name-giving genus of the whole group. See *cut* under *Ploceus*. (For those *Ploceidae* known as *whisker-birds*, see *Vidua*.)

weaving (wē'ving), *n.* [*<* ME. *weyunge*, *wef-fyng*; verbal *n.* of *weave*, *v.*] 1. The act of one who or that which weaves; specifically, the act or art of producing cloth or other textile fabrics by means of a loom from the combination of threads or filaments. In weaving all kinds of fabrics, whether plain or figured, one system of threads, called the *woof* or *weft*, is made to pass alternately under and over another system of threads, called the *warp*, *weeb*, or *chain*. The essential operations are the successive raising of certain threads of the warp and the depression of others, so as to form a *shed* for the passage of the weft-yarn, which is then beaten up by means of a *lathe* or *batten*. Weaving is performed by the hand in what are called *hand-loom*s, or by steam-power in what are called *power-loom*s, but the general arrangements for both are to a certain extent the same. (See *loom*.) Weaving, in the most general sense of the term, comprehends not only the manufacture of those textile fabrics which are prepared in the loom, but also that of network, lacework, etc. See *cut* under *shuttle*.

2. In the *manège*, the action of a horse that weaves, or moves the body from side to side.

Piers Plowman (B), v. 111.

My dochter she's a thrifty lass;
She span seven year to me;
An' if it war well counted up,
Full ten *wēbs* it would be.

Kempy Kaye (Child's Ballads, VIII, 140).

At noon
To-morrow come, and ye shall pay
Esch fortieth *wēb* of cloth to me,
As the law is, and go your way.

M. Arnold, *The Sick King in Bokhara*.

Ure, *Dict.*, III, 403.

5. Any one of various thin and broad objects, probably so named from some similarity to the thin, broad fabric of the loom. Especially—(a) A sheet or thin plate, as of lead.

(m) The arm of a crank.

6. In *ornith.*, the blade, standard, vane, or vexillum of a feather: so called from the texture acquired through the weaving or interlocking of the barbs by the barbules with their barbicels and hooklets. That vane which is furthest from the middle linc of the bird's body is the *outer web*; the other, the *inner web*, is technically distinguished as *pogonium externum* and *internum*. The two often differ from each other in size, shape, or color, or in all these respects; the difference is most pronounced on the flight-feathers

(as seen in any quill pen) and lateral rudder-feathers. See *cuts* under *aftershaft*, *barb*, *ocellate*, and *peniciling*.

Gr. ἐν τῷ τάζει ἐφημερίας αὐτοῦ, L. in ordine vicis suæ, 'in the order of his course,' Luke i. 8, but prob. to be taken, in the Goth., as 'in the week or period of his course,' wikon appearing to mean 'succession,' 'change,' 'week' 'recurrent period,' and to be allied to leel. rēikja, turn, return, etc.: see *week*. The collocation of the Goth. wikon and the L. vicis in this passage, and the resemblance of form, have given rise to the notion that the Teut. word is borrowed from the L.; but the L. word equiv. to wikon is *ordine*, and there is no evidence that L. *vic, vicis was ever used in the sense 'week.'*] 1. A period of seven days, of which the days are numbered or named in like succession in every period — in English, Sunday (or first day, etc.), Monday, Tuesday, Wednesday, Thursday, Friday, Saturday (or seventh day); hence, a period of seven days. The week is not dependent upon any other period, as a subdivision of that period, but cuts across the division-lines of month and year alike with its never-ending repetition. In general Jewish and Christian belief, it is founded on the creation of the world in six days (according to the account in Genesis), with a succeeding seventh day of rest, specially commemorated by the Jewish rest-day, or Sabbath, our Saturday. It has also been conjectured to represent a fourth of the lunar month of about 28 days; but no people is known as having made and maintained such a subdivision of the month. As a period and division of time, its use is limited to Jews and Christians (including also in some measure the Mohammedans, by derivation from these); but the week-day names and their succession are found more widely, and are of a wholly different origin; they rest upon an astrological principle, which assigns each day in succession to one of the planets as regent; and they further involve a division of the day into 24 hours. If the planets are arranged in the order of their distance from us as held by the ancients — namely, Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon, — then, if the first hour of a day is allotted to Saturn, and each following hour to the next planet, the 25th hour, or the first of the next day, will fall to the Sun, the 49th, or the first of the following day, to the Moon, and so to Mars, Mercury, Jupiter, Venus, in succession; and each planet being reckoned as regent of the whole day of whose first hour it is regent, the days are Sun's day, Moon's day, Mars' day, and so on to Saturn's day, where the same succession is taken up anew. These names were unknown to, or at least never used by, the Jews, nor do they appear in classical Greek, nor do the Mohammedans employ them; but they passed from Roman use to European, and not only in their Latin forms, but also as translated into Germanic languages, the names of Germanic divinities being, by a rude identification, substituted in them for those of the Roman, as Mars, etc., without any regard to the planets (see the names Tuesday, etc.); and they are found also in India, which doubtless received them, with the rest of its astronomy and astrology, from Greece and Rome. The Indian days are coincident with our days of the same name — that is, it is Sun's day there when it is our Sunday, and so on. But there is no other than an astrological significance belonging to the names there; a week as a division of time is wholly unknown to both ancient and modern India. In law, *week* is sometimes construed to mean any period of seven full days, and sometimes to mean such a period beginning with the beginning of a Sunday. Thus, a requirement of "a week's notice" may be satisfied by the lapse of any seven consecutive days, but a publication of a notice "once in each week for three weeks before the sale" is held to contemplate three weeks reckoned as from Sunday to Sunday, not merely 21 days before the sale. Abbreviated *nr. wk.*

The *wef* was so called from its being "wafted" in and
out of the warp; it is also often called the *woof*, though
more correctly the *woof* is the same as the web or
finished stuff. *Encyc. Brit.*, XXIII. 206.

2. In bot., a name sometimes given to a felt-
like stratum produced in certain fungi by abun-

in some looms to lay in, piece by piece, a filling
of slats, whalebone, palm-leaf, or other stiffen-
ing material.—2. An early arrangement for
stopping a loom in case of the failure of the
weft-thread. It is essentially a weighted lever,
which is supported by the weft-thread, and performs its action
by falling in the event of the breakage or failure of the
thread.

wef-hook (weft'hūk), n. A tool used to draw
the filling through the warp in some kinds of
hand-weaving, as in slat-weaving and some
narrow-ware weaving or ribbon-weaving.

Wehrle, an Austrian metallurgist and mining
official (1791-1835).] A mineral obtained from
Deutsch-Pilsen, in Hungary, in steel-gray folia
with bright metallic luster and high specific
gravity (8.4). It consists essentially of bismuth and

Weierstrassian (vī-ēr-stras'i-an), a. Of or
pertaining to, or named from, K. T. W. Weier-
strass, a German mathematician (born 1816).
—**Weierstrassian function**. (a) One of the functions
used in Weierstrass's method of treating elliptic functions.
(b) The function

$$fz = \sum_{n=1}^{\infty} b^n \cos^2(an) \pi z.$$

In certain cases, as when $p = 1$, $b < 1$, $ab > 1 + \frac{1}{2}\pi$, this func-
tion, although continuous, has no differential coefficient.
In fact, the curve of the function, when seen at a distance,
appears like a simple curve of sines; but when it is mag-
nified, small waves are seen upon it; under a higher mag-
nifying power, wavelets on these waves; and so on *ad in-
finitum*; so that, although $f(x+h) - fz$ becomes infi-
tesimal with h , yet it has no limiting ratio to h .

Baker, *Chronicles*, p. 117.

3. To be or amount in heaviness or weight; be of equal effect with in the balance: as, a nugget *weighing* several ounces; a load which *weighs* two tons. The terms expressing the weight are in the adverbial objective. That which a balance measures is the proportionate acceleration of masses toward the center of the earth. This is equal to their proportionate masses; and mass is the important quantity determined. The weight, or attraction of gravitation (less the centrifugal force), differs at different stations, and is not determined by the operation of weighing.

weighing-machine (wā'ing-mā-shēn'), *n.* Any contrivance by which the weight of an object may be ascertained, as the common balance, spring-balance, steelyard, etc.

See cuts under *balance* and *steelyard*. The term is, however, generally applied only to those contrivances which are employed for ascertaining the weight of heavy bodies, as the machines for the purpose of determining the weights of laden vehicles, machines for weighing cattle, machines for weighing heavy goods, as large casks, bales, etc. The *hydrostatic weighing-machine* (see cut) consists essentially of a strong cylinder within which moves a tightly packed piston, the space being filled with castor-oil; the loop above is attached to the cylinder and the ring below to the piston. When the object to be weighed is hung on the ring, the piston presses on the oil, and this passes by a channel to a gage

which indicates by the motion of the index on the dial the weight in pounds and tons.

Downward force of a body; gravity; heaviness; ponderousness; more exactly, the resultant of the force of the earth's gravitation and of the centrifugal pressure from its axis of rotation, considered as a property of the body affected by it. Considerable confusion has existed between weight and mass, the latter being the quantity of matter as measured by the ratio of the momentum of a body to its velocity. Weight, in this the proper sense of the word, is something which varies with the latitude of the station at which the heavy body is, being greater by $\frac{1}{15}$ of itself at the poles than at the equator; it also varies considerably with the elevation above the sea ($\frac{1}{175}$ for every kilometer). The weights of different bodies at one and the same station were proved, by Newton's experiments with pendulums of different material, to be in the ratio of their masses, and irrespective of their chemical composition; consequently, a balance which shows the equality of weight of two bodies at one station also shows the equality of their masses. In determining the specific gravity of a body, it is hung by a fine thread to one pan of the balance, and immersed completely in water. The reduced number of pounds, ounces, etc., which is required in the other pan to balance the first, under these circumstances, is called the weight of the body in water. In like manner, we speak of the weight in air and the weight in water. These expressions forbid our conceiving of weight as synonymous with the quantity of matter; and yet, when a pound is said to be a unit of weight, although it is intended to be carried up mountains and to distant places, mass, or quantity of matter, must be understood, since there is no important quantity but the quantity of matter which a pound or a kilogram measures. The confusion is increased when the pound is defined, as it still is in the United States, by the weight of a certain standard in air, without reference to the height of the barometer and thermometer. In the older books on mechanics, a pound is taken as a force, and the quantity of matter is obtained by dividing the weight by the measure of gravity; but now both the theoretical books and the legal definitions of the standards used in weighing make the pound, kiln, etc., to be masses, or quantities of matter, whose weight is obtained by multiplying them by the acceleration of gravity at any station. Nevertheless, the older system still finds a few supporters. It was long after Galileo had firmly established the law of falling bodies before it occurred to anybody that weight was a force. Gravity, so far as common observation shows, draws bodies to the earth alone, and that in parallel lines, and Galileo had shown that it accelerates all bodies alike, whether they are great or small, so that there was nothing to suggest the idea of force, especially as that idea was then in its infancy, and had not attained its present prominence in the minds of men. Weight in those days being looked upon as a property of single bodies, and not as subsisting between pairs of bodies, was necessarily confounded with mass; and a mental inertia, or natural clinging to old conceptions, kept up the confusion after Newton had demonstrated the true law of gravitation. For the units of weight, see def. 5. Abbreviated *wt.*

2. Mass; relative quantity of matter.—3. A heavy mass; specifically, something used on account of its weight or its mass. Thus, the usefulness of the weights that a man holds in his hands in leaping or jumping lies in the addition they impart to his momentum, and their dragging him down is a disadvantage; but the weights of a clock are for giving a downward pull, and their momentum is practically nothing.

A man leapeth better with *weights* in his hands than without.
Bacon, *Nat. Hist.*, § 699.

Both men and women in Cochín account it a great Gallantry to have wide eares, which therefore they stretch by arte, hanging *weights* on them till they reach to their shoulders.
Purchas, *Pilgrimage*, p. 494.

As allas that I bilighite
Of pured gold a thousand pound of *weight*.
Chaucer, *Franklin's Tale*, l. 132.

So Belgian mounds bear on their shattered sides
The sea's whole *weight*, increased with swelling tides.
Addison, *The Campaign*.

Though a pound or a gramme is the same all over the world, the *weight* of a pound or a gramme is greater in high latitudes than near the equator.

Clerk Maxwell, *Matter and Motion*, Art. xlvii.

2. Mass; relative quantity of matter.—3. A heavy mass; specifically, something used on account of its weight or its mass. Thus, the usefulness of the weights that a man holds in his hands in leaping or jumping lies in the addition they impart to his momentum, and their dragging him down is a disadvantage; but the weights of a clock are for giving a downward pull, and their momentum is practically nothing.

4. Specifically, a body of determinate mass, intended to be used on a balance or scale for measuring the weight or mass of the body in the other pan or part of the scale (as the platform in a platform-scale).—5. A system of units for expressing the weight or mass of bodies. *Avoirdupois weight* is founded on the avoirdupois pound (see pound¹), which is equal to 433.5926525 grams. It is divided into 16 ounces, and each ounce into 16 drams: 112 (in the United States commonly 100) pounds make a hundred-weight, and 20 hundred-weights a ton. (See ton¹.) The stone is 14 pounds. *Troy weight* is founded on the troy pound, which is 373.242 grams. It is divided into 12 ounces, each ounce into 20 pennyweights, and each pennyweight into 24 grains. But formerly the pennyweight was divided into 32 real grains. There was also an ideal subdivision of the grain into 20 mites, each of 24 droites, each of 20 perits, each of 24 blanks. The goldsmiths also divided the ounce troy into 24 carats of 4 grains each for gold and silver, and into 150 carats of 4 grains each for diamonds. Troy weight, formerly employed for many purposes, is now only used for gold and silver. *Apothecaries' weight*, still used in the United States for dispensing medicine, divides the troy ounce into 8 drams, each dram into 3 scruples, and each scruple into 20 grains, which are identical with troy grains. For weight in the metric system, see metric³.

6. Pressure; burden; care; responsibility.
A wise Chieftain never trusts the weight

Oppress'd with Drops of a hard-falling Show'r,
Bend with its Weight of Grief? Congreve, *To Cynthia*.

7. In coal-mining, subsidence of the roof due to pressure from above, which takes effect as the coal is worked away. In long-wall working, the weight is usually of importance, as causing the coal, after it has been holed, to "get itself"—that is, to break down without the necessity of using powder, wedges, or something similar. Properly, "weight" is the cause and "weighting" the result, but the two words are often used with nearly the same meaning.

8. Importance; specifically, the importance of a fact as evidence tending to establish a conclusion; efficacy; power of influencing the conduct of persons and the course of events; effective influence in general. In calculations by least squares, the weight assigned to an observation is its effect upon the result, expressed by its equivalence to a certain number of concordant observations of standard accuracy.

It happens many times that, to urge and enforce the matter we speak of, we go still mounting by degrees and increasing our speech with words or with sentences of more weight one than another, & is a figure of great both efficacy & ornament. . . . We call this figure by the Greek original, the Auancer or figure of increase, because every word that is spoken is one of more weight than another. Puttenham, *Arte of Eng. Poesie*, p. 182.

For well seneugh they understood
The matter was of weight.

Battle of Balinnes (Child's Ballads, VII. 223).

As men are in quality and as their services are in weight for the public good, so likewise their rewards and encouragements . . . might somewhat declare how the state itself doth accept their pains.

Edinburgh Rev., CLXIII. 568.

9. In med., a sensation of oppression or heaviness over the whole body or over a part of it, as the head or stomach.—**Atomic weight**. See *atomic*.—**Dead weight**, the pressure produced by a heavy body supported in a state of rest by anything; used literally and figuratively.

Same as *overheating thermometer* (which see, under *thermometer*).—**Molecular weight**, the weight of a molecule, that of hydrogen being taken as the standard.—**Weight of an observation**, the number of ordinary observations to which it is considered as equivalent in the deduction of the most probable value. Compare def. 8.—**Weight of a reciprocal**. See *reciprocal*.—**Weight of metal**, the weight of iron capable of being thrown at one discharge from all the guns of a ship.—**Weight of wind**, in organ-building, the degree of compression in the air furnished by the bellows to a particular stop or group of stops. The usual pressure is sufficient to raise a column of water in a U-tube about 3 inches.

Weinmannia (win-man'i-ā), *n.* [NL. (Linnaeus, 1763), named after J. W. *Weinmann*, a German apothecary.] A genus of polyptelous plants, of the order *Saxifragaceae* and tribe *Cunouiceae*. It is characterized by flowers with imbricated sepals, four or five petals, eight or ten long stamens inserted on the base of a free disk, and small oblong, commonly pilose seeds. There are about 60 species, principally of tropical or south temperate regions, occurring in America, Australia, New Zealand, and the Mascarene and Pacific Islands. They are trees or shrubs with opposite branchlets, opposite coriaceous, often glandular leaves, odd-pinnate with a winged rachis. The small white flowers are disposed in simple terminal or axillary erect racemes, followed by small coriaceous two-celled capsules splitting into two sharp boat-like valves. Some species afford a soft light wood used in carpentry and cabinet-work. A Peruvian species yields an astringent bark utilized in tanning. *W. tinctoria* is employed in the Isle of Bourbon in dyeing red. *W. pinata*, a tree with downy branches, native from the West Indies and Mexico to Guiana, is known in Jamaica as *bastard brazilletto*. *W. Benthami*, an evergreen tree of New South Wales, reaches 100 feet high; 4 others are Australian, and 2 occur in New Zealand, of which *W. sylvicola*, a small tree with blackish bark, is now cultivated in England, and *W. racemosa* is known as the *tawai-bark tree*.

weir, **weir³** (wēr), *n.* [The spelling *weir* is irreg. and appar. Sc.; the proper spelling is *weir*; early mod. E. *wear*, *weare*, *were*, sometimes *wire*; < ME. *wer* (dat. *were*), < AS. *wer*, a weir, dam, fence, hedge, inclosure, = G. *wehr*, a weir, dam, dike, = Icel. *vörr*, a fenced-in landing-place; from the root of AS. *werian*, protect, guard, defend, etc., also fence, dam: see *weir²*.]

1. A dam erected across a river to stop and raise the water, as for the purpose of taking fish, of conveying a stream to a mill, of maintaining the water at the level required for navigating it, or for purposes of irrigation.

Half the river fell over a high *weir*, with all its appendages of bucks, and hatchways, and eel-baskets, into the Nun's-pool. *Kingsley*, *Yeast*, iii.

2. A fence, as of twigs or stakes, set in a stream for catching fish. Weirs differ from pounds principally in being constructed, in whole or in part, of brush or of narrow boards, with or without netting; and they are sometimes arranged so that at low tide a sand-bar cuts off the escape of the fish, leaving them in a basin, and allowing them to be taken at any time before a certain stage of rise of the next tide. Weirs are of two kinds, the *shoal-water weir* and the *deep-water weir*. The *shoal-water weir*, as illustrated in fig. 1, has a leader L, which is a row of stakes, generally woven with brush, leading out from the shore. Its extremity is at the entrance of the big

1, shoal-water weir; 2, deep-water weir.

pound M. The big pound is likewise of stakes filled with brush, and its entrance 30 feet wide. This leads by a passage 5 feet wide into the little pond N, and this into the pocket O, which is a frame about 16 feet long and 10 feet wide, with sides of netting, and a board floor. The fish following the shore meet the leader, turn and follow it into the big pound; here they follow the side around until they pass into the little pond, and from that into the pocket, where they are left by the receding tide and taken out at low water. The deep-water weir (fig. 2) has a similar leader A, extending to the entrance of the big pound, or heart, B, beyond which are the small pond C and the bowl D, into which the fish finally go. The form of the inclosures in both cases leads the fish constantly forward, and they rarely or never find their way back through the passages. In both figures E represents the land or high-water mark, and F the low-water mark.

The day following we came to Chippanan, where the people were fled, but their *weirs* afforded us fish.

Quoted in *Capt. John Smith's Works*, I. 90.

See def. 2.—**Dry weir**, a weir on a flat which is left bare at ebb-tide.—**Half-tide weir**, a fish-weir so placed that the fish taken can be removed at half-ebb or half-tide, without waiting for low tide, as is generally done.—**Lock-weir**, a weir having a lock-chamber and gates. *E. It was formerly much cultivated as a dye-plant, its pods affording a permanent yellow suited to both animal and vegetable fibers, later displaced, however, by quercitron, flavin, and the aniline dyes. Its seeds yield a drying-oil. Also *weld-weed*, and sometimes *woad* or *wild woad*.

weld² (weld), *v.* [Ult. a variant, through the Scand. forms, of *well*, *boil*: see *well*¹.] I. *trans.*

1. To unite or consolidate, as pieces of metal or a metallic powder, by hammering or compression with or without previous softening by heat. Welding is and has long been a matter of great practical importance, chiefly in the manufacture of iron and steel, and of the various tools, utensils, and implements made of those metals. Iron has the valuable property of continuing in a kind of pasty condition through quite a wide range of temperature below its melting-point, and this is a circumstance highly favorable to the process of welding. Most metals, however, pass quickly, when sufficiently heated, from a solid to a liquid condition, and with such welding is more difficult. The term *welding* is more generally used when the junction of the pieces is effected without the actual fusing-point of the metal having been reached. Sheets of lead have sometimes been united together by fusing the metal with a blowpipe along the two edges in contact with each other, and this has been called *autogenous soldering*, or *burning* if the heating was done with a hot iron. Still, "the difference between welding and autogenous soldering is only one of degree" (Percy). The term *welding* is also used in speaking of the uniting of articles not metallic. Most metals when in the form of powder can be consolidated or welded into a perfectly homogeneous mass by sufficient pressure, without the aid of heat. The same is true of various non-metallic substances, such as graphite, coal, and probably many others. A method of welding has been recently invented by Elihu Thomson, which appears to be capable of being employed with a variety of metals on a very extensive scale. In this, which is known as *electric welding*, a current of electricity heats the abutting ends of the two objects which are to be welded, these being pressed together by mechanical force, and so arranged with reference to the electric current that there is a great and rapid accumulation of heat at the joint, in consequence of the greater relative conductivity of the rest of the circuit. This method of welding in some cases partakes of the nature of autogenous soldering, the pieces of metal being actually fused while uniting; in other cases, as with iron, nickel, or platinum, the union may take place without fusion, as in ordinary welding. In electric welding the pressure which forces the metallic surfaces together may, in the case of a plastic metal like iron, be either quiet or percussive in character; in autogenous soldering a more delicate and quiet pressure is generally preferred. In case of large articles hydraulic pressure can be used to force their surfaces into contact with each other.

well² (wel), *n.* [*ME. well* (*well¹*), also *welle*, *wulle*, *wille*, < *AS. well*, *wyll*, also *wella*, *wylla*, a well, spring (= *MD. welle*, *D. wel* = *OHG. wella*, *MHG. A natural source of water; a place where water springs up in or issues from the ground; a spring or well-spring; a fountain. As soon as a spring begins to be utilized as a source of water-supply it is more or less thoroughly transformed into a well. (See def. 4.) This is necessary, both for rendering the access to it convenient, and for giving the water a chance to accumulate and be protected when not needed for use. Hence the word *spring* is much used by geologists in describing the natural sources of water-supply, and *well*, by those indicating the manner in which the supply has been made available. There is, however, no sharp distinction possible between the two words. Thus, *Prestwich* speaks of the "beautiful spring [between Cirencester and Cheltenham] known as the Seven Wells," and *Phillips* of a "feeble intermittent spring [issuing from Giggleswick Scar, in Yorkshire] known as the Ebbing and Flowing Well."

4. A pit, hole, or shaft sunk in the ground, either by digging or by boring through earth and rock, to obtain a supply of water, or of other fluid, as mineral water, brine, petroleum, or natural gas, from a subterranean source, and walled or otherwise protected from caving in. Wells are generally cylindrical, and are sometimes bored to a depth of several hundreds or thousands of feet. (See *Artesian well*, under *Artesian*. See also *oil-well*, *tube-well*.) From ordinary wells for domestic use the water is raised in vessels—generally buckets hung in pairs to a windlass

or singly to a well-sweep—or, as from deeper wells, by pumping.

= **Syn. 4. Well, Spring, Fountain, Cistern**. A *well* is an artificial pit sunk to such a depth that water comes into the bottom and rises to the water-level, ready to be drawn up. A *spring* is a place where water comes naturally to the surface of the ground and flows away: a *spring* may be opened or struck in excavation, but cannot be made. A *fountain* is characterized by the leaping upward of the water: it may be natural, and thus be a kind of *spring*, or it may be artificial, as in a public square. A *cistern* is an artificial receptacle for the storage of water, as that which is conducted from roofs; figuratively, the word may be applied to similar natural subterranean reservoirs.

The only species, *W. mirabilis*, is a native of sandy regions of southwestern tropical Africa, in Benguela and Damara-land, between 14° and 23° south latitude.

1. Entire plant. 2. Branch of the panicle. 3. a, stamen—tube laid open, showing the enclosed ovule; b, pollen-grains; c, scale of cone with flower-bud; d, seed, longitudinal section, showing the calyptriform integument at its apex; e, ripe seed and base of pericarp; f, pericarp with styliform apex of the integument of the seed; g, embryo.

Its thick trunk bears but two leaves. The original cotyledons, which are opposite, green, spreading, and persistent, are composed of a hard fibrous substance, and become often 6 feet long and 2 or 3 wide. They finally split into long shreds, but are still retained, it is said, through over a hundred years of growth. The mature trunk forms a tabular mass only about a foot high, but 5 or 6 feet across; the top is truncate, hard, pitted, and broken by cracks, and resembles a fungus of the genus *Polyporus*; the base is deeply sunk in the soil, and produces middle-sized roots. The panicle inflorescence is composed of rigid erect dichotomously jointed stems from 6 to 12 inches high, with two opposite scales sheathing each joint, and is developed annually from the upper side of the trunk at the base of the cotyledons. The flower-spikes are composed of brilliant scarlet scales overlapping, usually in four rows—the male with spikes 1½ inches long or under, the female larger, fewer, and thicker. Each scale contains a flower, the male a small loose membranous perianth, the filaments connate into a loosely exerted tube, and six anthers, each opening by three apical and finally confluent pores. The fruit is dry, two-winged, compressed, enclosed in a fibrous utricle. The new growth is chiefly horizontal, enlarging the stem both above and below the base of the leaf, which finally projects from a deep marginal cavity.

He was the principal exponent of the so-called Neptunian theory of the earth's formation, according to which the earth was originally covered by a chaotic ocean which held the ma-

terials of all the rocks in solution, and from which ocean the various formations were precipitated one after another.

The **Wernerian** notion of the aqueous precipitation of "Trap" has since that date never held up its head.

Gr. *λύκάνθρωπος*, > ML. *lycaanthrops*, > E. *lycaanthropy*), < *wer*, man, + *wulf*, wolf: see *wer*¹ and *wolf*.] In old superstition, a human being turned into a wolf while retaining human intelligence. This transformation was either voluntarily assumed, through infernal aid, for the gratification of cannibalism or other heastly propensities, or inflicted by means of witchcraft; and it might be made and unmade at its subject's will in the former case, or be either temporary or permanent in the latter. A voluntary werwolf was the most dangerous of all creatures, and trials of men on charge of crimes committed while in this form took place in Europe as late as the seventeenth century. But an involuntary werwolf might retain humane feelings and sympathies, and act beneficently as the protector of persons in distress or otherwise; and many medieval legends are based upon this idea. The former belief in werwolves throughout Europe (not yet entirely extinct in regions where wolves still abound) has given the general name *lycaanthropy* to belief in the metamorphosis of men into beasts of any kind (generally the most destructive or obnoxious of the locality), prevalent among nearly all savage and semi-civilized peoples.

The wet meter regulates the flow of gas more steadily than the dry meter, but is more difficult to keep in order.—**Wet plate**, in *photog.*, a plate coated with collodion and sensitized with a salt (usually the nitrate) of silver: so called because it is necessary, in this process, to perform all the operations of making the picture, to and including the final fixing of the plate, before the coating of collodion dries. For some thirty years, from about 1850, this was by far the most important photographic process in use, but it is now almost wholly superseded by the various rapid dry-plate processes. The phrase is also used attributively to note the process or anything connected with it. See *collodion process*, under *collodion*.—**Wet port**, a seaport as a place of entry for foreign goods, in distinction from a *dry port*, or land-port, a place of entry for goods transported by land. *Encyc. See *steam* and *open*, 13.—**Wet way**, in *chem.*, the method of qualitative and quantitative analysis and assay in which the substance to be examined is first dissolved in some liquid and then treated with liquid reagents: the opposite of fire-assay, or treatment in the dry way. In the ordinary analysis of minerals, the substance is first finely pulverized and then dissolved in an acid, after which further treatment follows. If insoluble in an acid, it is fused with potassium or sodium carbonate, after which treatment the fused mass is soluble, either wholly or in part, the silica (if the mineral is a silicate) separating out and being removed by filtering, after which the process is continued the same way as when the substance is soluble without the necessity of a preliminary attack by an alkali at a high temperature. Ordinary analyses of minerals are made in the wet way, assays of ores not infrequently in the dry way.—**With a wet finger**, with little effort or trouble; very easily or readily: probably from the practice of wetting the finger to facilitate matters, as in turning over a leaf of a book, or rubbing out writing on a slate.

To wet down paper, in *printing*, to dip paper in water, or sprinkle it in small portions, which are laid together and left under pressure for a time to allow the moisture to spread equally through the mass. The dampness of the paper fits it for taking the ink readily and evenly in the process of printing, and prevents it from sticking to the type. The finest printing, however, is done with dry paper, and ink of a suitable quality for such use.—**To wet one's line**. See *line*, 2.

1. A unit of weight, 14 stone according to the old statute *de ponderibus*. But a wey of wool is 6½ tons, or 13 stone; locally, 30, 30½, or 31 pounds. A wey of hemp was 30 pounds in Somersetshire, 32 pounds in Dorsetshire, being 8 heads of 4 pounds, twisted and tied. A statute of 1430 declares that cheese shall not be weighed by the ounce, but by the wey of 32 cloves, each clove of 7 pounds, except in Essex, where it is 256 pounds, or 32 cloves of 7½ pounds. But locally it was 3 hundredweight, or 416 pounds.

Hence—2. A unit of measure, properly 40 bushels. So a statute of George III. makes a wey of salt one ton, which is 40 bushels. But another statute of the same monarch makes a wey of meal 48 bushels of 84 pounds each; and in Devonshire a wey of lime, coals, or culm was sometimes 48 double Winchester bushels. So in South Wales a wey of coals is 6, not 5, chaldrons.

3. An amount of window-glass—60 eases.

whale¹ (hwāl), *n.* [*< ME. hwal, whal, qual, qual, < AS. hwal (pl. hwalas) = MD. wal = Icel. hvalr = Sw. Dan. hval, a whale, including any large fish or cetacean; also in comp. D. walruseh = OHG. walruse, MHG. wal-ruseh, G. walruseh = Icel. hvalrusek = Sw. Dan. hvalrusek (see whale-fish); cf. OHG. walirā, MHG. walre, a whale; cf. also MHG. G. wels, shad. Hence ult. in comp. E. walrus, narwhal, horsewhale; ultimate origin unknown. Skeat connects whale¹, as lit. 'the roller,' with wheel; others connect it with L. balæna, a whale. Both derivations are untenable.] Any member of the mammalian order *Cetacea* or *Cete* (which see); an ordinary cetacean, as distinguished from a sirenian, or so-called *herbivorous cetacean*; a marine mammal of fish-like form and habit, with fore limbs in the form of fin-like flippers, without external trace of hind limbs, and with a naked body tapering to a tail with flukes which are like a fish's caudal fin, but are horizontal instead of vertical; especially, a cetacean of large to the largest size, the small ones being distinctively named *dolphins, porpoises*, etc.: in popular use applied to any large marine animal. (a) *Whale* is not less strictly applicable than universally applied to the toothless or whalebone whales, all of which are of great size, and some of which are by far the largest of animals. They consist of the right whales, finner-whales, and humpbacks, composing the family *Balenidae* alone, and represent five well-marked genera, namely: (1) *Balæna* proper, the right whales, without any dorsal fin and with smooth throat; (2) *Neobalæna*, based on *N. marginata*, a whalebone whale said to combine a smooth throat with presence of a dorsal fin; (3) *Rachianectes*, with one species, *R. glaucus*, the gray whale; (4) *Megaptera*, the humpbacked whales, with a dorsal fin, furrowed throat, and long flippers, of several nominal species of all seas; and (5) *Balenoptera*, the true finners, or orquals, with dorsal fin, furrowed throat, and short flippers: it comprises at least four, and probably more, species. Various other genera have been named as *Agapetus* for certain so-called scrag-whales, and the generic synonyms of these whales are probably more numerous than the actual species. (b)*

Skeleton of Southern Right Whale.

Whale is extended, nearly always with a qualifying word, to most of the odontocete or toothed cetaceans, and especially to those of great size, as the sperm-whale, but also to some of the smallest, no larger than a dolphin, as the pygmy or porpoise sperm-whales of the genus *Kogia*, and to various forms of intermediate sizes, as the pilot-whales (*Globicephalus*), the bottle-nosed or bottle-headed whales (*Hyperoodon*), the white whales (*Delphinapterus*), etc. Some of these whales also have distinctive names, into which *whale* does not enter, as *blackfish, beluga, bottlehead, bottlenose, grampus, killer*, etc., or they share the qualified names *porpoise* and *dolphin* with various small cetaceans more properly so called. The genera and species of the toothed whales are much more numerous than those of the baleen whales; their synonymy is very extensive and intricate, and is in some cases in a state of confusion which can only be cleared up by future research. (c) In geologic time whales date back to the Eocene; and a suborder *Archæoceti* (contrasted with *Odontoceti*) and a suborder *Myxodonti* has been named to cover certain forms still only imperfectly known from fragmentary remains. (See *Zeeuwholven*.) The oldest whales like any of the living forms date from the late Eocene, and are toothed whales related to the humpbacks. Whalebone whales are not known to be older than the Pliocene. (d) In present geographical distribution whales are found in all seas, and some of them enter rivers. Most of the species are individually wide-ranging on the high seas, and attempts which have been made to discriminate similar forms from different waters have in most cases proved futile. Several of the larger forms have been the objects of systematic fisheries for centuries. (See *whale-fishery*.) The principal products are oil, both train and sperm, baleen or whalebone, spermaceti, and ambergris; the hide of some of the smaller whales affords a leather. Whales are exclusively carnivorous, and feed for the most part upon a great variety of small animals which float on the surface of the sea, generally known collectively as *brit* or *whale-brit*. This includes various cephalopods, as squids and cuttles, with other mollusks of different orders, as well as several different kinds of crustaceans. *Brit* of some kinds covers the ocean

In immense areas, to which the whales resort as feeding-grounds. Some whales attack large animals, even of their own kind (see *killer, Orca*), but nearly all are timid and inoffensive, seeking only to avoid their enemies, though capable of formidable resistance to attack. Whales bring forth their young alive, like all mammals above the monotremes, and suckle them; the teats are a pair, beside the vulva. They breathe only air, for which purpose they must regularly seek the surface, though capable of remaining long under water without respiring. The spouting of the whale is the act of expiration, during which the air in the lungs, loaded with watery vapor, is forcibly expelled like spray in a single stream, or in two streams, according as the blowholes are single or there are a pair of these spiracles. Some sea-water may be mixed with the breath, if the whale spouts beneath the surface, but the visible stream is chiefly condensed vapor, like that of human breath on a cold day. Whales have a naked skin, saving a few bristles about the mouth, chiefly in the young; the hide is often incrustated with barnacles, or infested with other crustacean parasites. The bodily temperature is maintained in the coldest surroundings by the heavy layer of blubber which lies under the skin of the whole body, and in the sperm-whale forms a special deposit on the skull, giving its singular shape to the head. The general form of the body is like that of a fish, in adaptation to entirely aquatic habits and means of locomotion. It tapers behind the body-chest in a solid muscular part, the *small*, and ends in broad, short flukes lying horizontally and extending from side to side. This tail-fin is the principal organ of locomotion, like the vertical caudal fin of a fish. The fore limbs form flippers of varying length in different species. These flns are of medium length in the right whale, short in the sperm and orqual, and extremely long in the humpback. In all cases the pectoral fin has a skeleton composed of the same joints or segments as the fore limb of ordinary mammals, and of all the usual bones except a clavicle; but the digital phalanges are more numerous. The dorsal fin, when present, is a mere excrescence, without any bony basis. There is never any outward sign of hind limbs, but the skeleton of some whales includes certain vestigial bones of a proximal segment of the pelvic limb, entirely separate from the spinal column, and apparently only serving in the male as a suspensorium for the penis. There is consequently no sacrum, nor any break in the series of vertebrae from the hindmost that bears ribs to the end of the spinal column. The cervical vertebrae offer exceptional conditions. (See cut under *ankylosis*.) The dentition of whales is sufficiently diverse to furnish characters of the main divisions of cetaceans. The entire toothlessness of the baleen whales is matched by few mammals (see *Edentata*); the presence of teeth in the lower jaw only, as in various odontocete whales, is peculiar; the dentition of the narwhal is wholly exceptional. Teeth, when present, are always homodont (like one another) and monophodont (there being no milk-teeth). The soft palate and the larynx are specialized in adaptation to the act of spouting. The digestive organs are comparatively simple; the uterus is bicornuous, the placenta diffuse and non-deciduate; the testes are abdominal; and there is no os penis nor seminal vesicle. The circulatory system is notable for its plexuses, both arterial and venous. Notwithstanding the outward resemblance to a fish, whales belong to the higher (educabillian) series of mammals, having a relatively large brain. One of the most remarkable of the many anomalies presented by this highly specialized order of mammals is the difference in size of its members, the range being far greater than that of any other

ordinal group—from 4 to about 80 feet in linear dimension. The size of the larger whales has been grossly exaggerated in many of the accounts which find popular credence. Adult right whales of different species range from 20 to 50 feet in length, only the polar whale attaining the latter dimension; the common humpback is from 40 to 50 feet long; the sperm-whale reaches 60 feet; and the orquals of several species range from 40 to 80 feet, the maximum length being reached only by the blue orqual, which is the largest of known animals.—**Arctic whale**, the polar whale, *Balæna mysticetus*; that right whale which is of circumpolar distribution, as distinguished from any such whale of temperate North Atlantic or North Pacific waters, or from which the latter are sought to be distinguished, as the *Atlantic, Pacific, northwest, or Biscay whale*.—**Atlantic whale**, the right whale of temperate North Atlantic waters. Also called *Pacific right whale*.—**Pilot-whale**. Same as *calling-whale*.—**Polar whale**, the right whale of the arctic Atlantic waters, or Greenland whale, *Balaena mysticetus*, more fully called *great polar whale*, and by many local names, as *bow-head*, *steep-top*, *ice-breaker*, *ice-whale*, etc.—**Pygmy sperm-whale**, a toothed whale of the genus *Kogia*; a porpoise sperm-whale (which see, under *sperm-whale*).—**Right whale**, a whalebone whale of the restricted genus *Balaena*: so called, it is said, because this is the "right" kind of whale to take. Right whales inhabit all known seas, and those of the main divisions of the waters of the globe have been specified by name, as the *arctic*, *polar*, or *Greenland right whale*, the *Atlantic*, the *Pacific*, the *southern*, the *north-west*, etc. These have received several technical names, as *B. mysticetus* of the Arctic ocean, *B. biscoyensis* or *is-arctica* of the North Atlantic, *B. australis* of the South Atlantic, *B. japonica* of the North Pacific, *B. antipodarum* of the South Pacific, and others. It is not likely that more than two valid species are represented in this synonymy: (a) *B. mysticetus* is of circumpolar distribution in the northern hemisphere. It attains a length of from 40 to 50 feet, has no dorsal fin, flippers of medium size, and very long narrow flukes, tapering to a point and somewhat falcate. The greatest girth is about the middle, whence the body tapers rapidly to the comparatively slender root of the tail. The throat is smooth; the head is of great size; and the eye is situated very low down and far back, be-

tween the base of the flipper and the corner of the mouth. The profile of the mouth is strongly arched, and its capacity is enormous, exceeding that of the thorax and abdomen together. This cavern is fringed on each side with baleen hanging from the upper jaw. The plates are 350 to 400 on each side, the longest attaining a length of 10 or 12 feet; they are black in color, and finely frayed out along the inner edge into a fringe of long elastic filaments. When the jaws are closed, the baleen serves as a sieve to strain out the multitudes of small mollusks or crustaceans upon which the whale feeds, and which are gulped in with many barrels of water in the act of grazing the surface with open mouth. About 300 of the slabs on each side are merchantable, representing 15 hundredweight of bone from a whale of average size, which yields also 15 tons of oil; but some large individuals render nearly twice as much of both these products. (b) The southern right whale, *B. australis*, differs from the polar whale in its proportionately shorter and smaller head, greater convexity of the arch of the mouth, shorter baleen, and more numerous vertebrae. It inhabits both Atlantic and Pacific Oceans in temperate latitudes, and in the former waters was the object of a fishery during the middle ages for the European supply of oil and bone. This industry gave way to the pursuit of the polar whale about the beginning of

the seventeenth century. This whale has long been rare in the North Atlantic, but has occasionally stranded on the European coast, and more frequently on that of the United States. A similar if not identical right whale is hunted in temperate North Pacific waters. Right whales are rare and not pursued in tropical seas, but are objects of the chase in various parts of the south temperate ocean. See cuts above, and under *Balenidae*.—**Rudolphi's whale**, the small finner-whale or orqual, *Balenoptera borealis*. See *northwest whale*, above.—**Smooth whale**, a whalebone whale having no plications of the skin of the throat and no dorsal fin, as a right whale; distinguished from *furrowed whale*. Pol. Very like a whale, Shak., Hamlet, iii, 2, 399.

Whalebone whale, a baleen whale; a toothless whale whose mouth contains whalebone; any member of the *Balenidae*, as a right whale, humpback, or orqual, whether furrowed or smooth.—**Whale of passage**, a migratory whale, or a whale during its migration.—**Whale's bone**, ivory; perhaps because supposed to come from the bones of the whale, at a time when the real source of the material was little known, or when most of the ivory used in western Europe consisted of the teeth of the walrus, confounded with the whale, and possibly those of the sperm-whale, which, though of comparatively small size, are of fine quality. The term was in common use for several centuries.

Her hands so white as whales bone,

Her finger tipt with Cassidone.

whale-boat (hwāl'bēt), *n.* A long narrow boat, sharp at both ends, and fitted for steering with an oar as well as with a rudder, used in the pursuit of whales, and, from its handy and seaworthy qualities, also for many other purposes. It is usually from 20 to 30 feet long. A pair of these boats is commonly carried by ocean passenger-steamers, in addition to their heavier boats.

whalebone (hwāl'bōn), *n.* and *a.* [*< ME. whale bone, grale-bon*; *< whale¹ + bon¹*.] *I. n. 1.* The elastic horny substance which grows in place of teeth in the upper jaw of whales of the family *Balenidae* (hence called *whalebone* or *bone whales*), forming a series of thin parallel plates from a few inches to several feet long; baleen (which see). The term is misleading, for the substance is in no sense bone, but a kind of horn; and its trade-name *whale-fin* is equally inaccurate, for it has nothing to do with the fins of the whale. Whalebone grows in several hundred close-set parallel plates along each side of the upper jaw of the baleen whale, and thus in the situation occupied by the teeth of ordinary mammals; it is entirely shut in by the lips when the mouth is closed. Each one of the plates of both rows then bends with a strong sweep backward, and when the mouth is opened straightens out, so that there is always a heavy fringe on each side of the cavity of the mouth, forming an impassable barrier to the multitudinous small creatures which the whale scoops in from the surface of the sea. The longest baleen plates are those of the polar whale, some of which may exceed 12 feet in length. The plates in different species differ in color from a dull grayish-black through various streaked or veined colorations to somewhat creamy white. Whalebone stands quite alone among animal substances in a particular combination of lightness, toughness, flexibility, elasticity, and durability, together with such a cleavage (due to the straightness of its parallel fibers) that it may be split for its whole length to any desired thinness of strips. A sulphur-bottom whale has yielded 800 pounds of baleen, of which the longest plates were 4 feet in length. In the California gray whale the longest bone is from 14 to 16 inches, of a light or whitish color, coarse-grained, and heavily and unevenly fringed. The baleen of a finback is of a light lead-color streaked with black, attaining a length of 2 feet 4 inches and a width of from 12 to 14 inches, with a fine fringe from 2 to 4 inches long; it is somewhat ridged crosswise. That of the sharp-headed finner is entirely white, with a short thin fringe; it has been found to consist of 270 pairs of plates, the longest being 10 inches in length. Whalebone is or has been used in the manufacture of a great variety of articles.

Four plates of baleen, seen obliquely from within.

(b) Sperm-oil or spermaceti-oil is obtained from the sperm-whale and other toothed cetaceans. 'that which is white' (with ref. to the color of the grain or the meal), *< AS. hwit*, etc., white; see *white¹*.] A cereal grain, the product of species of *Triticum*, chiefly of *T. sativum* (*T. vulgare*). The origin of the plant is not clearly known, but it is thought by many to be derived from a grass, *Egilops ovata*, of the Mediterranean region, now classed as a species of *Triticum*. The wheat-plant is a grass closely related to barley and rye, having a dense four-sided spike, and grains longitudinally furrowed on one side, turgid on the other. In some varieties the paleas bear awns, in others not, the varieties being respectively called *bearded* and *beardless* or *bald*. Some are planted in the spring—spring or summer wheat—others in the fall, maturing the next season—

winter wheat. The product of the latter was formerly preferred, but with recent methods of manufacture spring

wheat is equally valued. The varieties are further classified as *white* and *red* or *amber*, referring to the color of the grain; among winter wheats, at least, the white are more esteemed. The grain is highly nutritious, containing some 67 per cent. of carbohydrates, 13 per cent. of

albuminoids, together with small quantities of the mineral substances, potash, soda, etc., required by the animal system, with only 14 per cent. of water. For use it is chiefly converted into flour; the finest but not the most nutritious flour is nearest pure starch. The richer elements lie nearest the skin, and these are secured in "Graham" flour, which properly includes the whole grain, and by recent milling processes which appropriate all but the cuticle. Wheat was formerly made in England into a dish called *frumenty* or *fermenty*, by boiling it entire in milk, and seasoning. It is now largely used in America in the form of cracked, crushed, or rolled wheat, or wheat-grits. Wheat has been known from antiquity, being mentioned in Scripture; it is traceable to ancient Egypt, and is recorded as introduced into China about 2700 B. C. It now furnishes the principal breadstuff among all civilized nations. It is adaptable to various conditions and widely grown in temperate regions; it is not excluded by cold winters, but requires a mean summer temperature of not less than 57°. Among the principal countries which produce a surplus are the United States, Canada, Russia, Hungary, India, Australia, Egypt, Rumania, and Turkey. The varieties are very numerous, and there are several more or less strongly marked races, one of which is spelt.

Its original technical name was *Emberiza procne* (of Boddard, 1783, whence *Chera procne* of most modern writers), and it used to be called *Emberiza* or *Fringilla* or *Vidua* or *Chera castra*; but it is a monotype whose synonymy presents no serious difficulty. 2. [eap.] A member of one of the two great political parties of Great Britain, the other being the Tories (later the Conservatives). The Whigs were the successors of the Roundheads of the Civil War and the Country party of the Restoration. The name was given to them about 1679 as a reproach by their opponents, the Court party, through a desire to confound them with the rebel Whigs of Scotland (see *whig*³, 1). The Whigs favored the Revolution of 1688–9, and governed Great Britain for a long period in the eighteenth century. In general, they may be called the party of progress; one of their principal achievements was the passage of the Reform Bill in 1832. About the same time the name *Whig* began to be replaced by *Liberal*, though still retained to denote the more conservative members of the Liberal party. See *Liberal*, *Tory*.

The south-west counties of Scotland have seldom corn enough to serve them round the year: And . . . those in the west come in the summer to buy at Leith the stores that come from the north: And from a word, Whiggam, used in driving their horses, all that drove were called the Whiggamors, and shorter the Whigs. Now in that year,

after the news came down of Duke Hamilton's defeat, the Ministers animated their people to rise, and march to Edinburgh. And they came up marching on the head of their parishes, with an unheard-of fury, praying and preaching all the way as they came. The Marquis of Argyle and his party came and headed them, they being about 6,000. This was called the Whiggamor's inroad. And ever after that all that opposed the Court came in contempt to be called Whiggs. And from Scotland the word was brought into England, where it is now one of our unhappy terms of distinction.

Ep. Burnet, Hist. Own Times, I. 58.

I hate a Whig so much that I'll throw my Husband out of his Election, or throw myself out of the World! a Parcel of canting Rogues; they have always Moderation in their Mouths—rank Resistance in their Hearts—and hate Obedience even to their lawful Wives.

Mrs. Centlivre, Gotham Election, i. 1.

The prejudice of the Tory is for establishment; the prejudice of the Whig is for innovation. A Tory does not wish to give more real power to Government, but that Government should have more reverence. Then they differ as to the Church. The Tory is not for giving more legal power to the Clergy, but wishes they should have a considerable influence, founded on the opinion of mankind; the Whig is for limiting and watching them with a narrow jealousy.

Johnson, in Boswell, an. 1781.

3. [eap.] In *Amer. hist.*: (a) A member of the patriotic party during the revolutionary period.

The Hessians and other foreigners, looking upon that as the right of war, plunder wherever they go, from both Whigs and Tories, without distinction.

Robert Morris, Dec. 21, 1776, quoted in Lecky's Eng. in

[18th Cent., xlv.]

(b) One of a political party in the United States which grew up, in opposition to the Democratic party, out of the National Republican party.

It was first called the Whig party in 1834. Its original principles were extension of nationalizing tendencies, and support of the United States Bank, of a protective tariff, and of a system of internal improvements at national expense. It won the presidential elections of 1840 and 1848, but soon after divided upon the slavery question. It lost its last national election in 1852, and soon after many of its members became temporarily members of the American and Constitutional Union parties, but eventually most of its northern members became Republicans, most of its southern members Democrats.—**Consience-Whig**, in *U. S. hist.*, in the last days of the Whig party, one of those northern Whigs who were indisposed to regard the compromise of 1850 as a final settlement of the slavery question: so called from their conscientious objections to such compromises with slavery.—**Cotton-Whig**, in *U. S. hist.*, in the last days of the Whig party, one of those northern Whigs who were disposed to regard the compromise of 1850 as a final settlement of the slavery question: so called from their supposed partiality to the cotton interest.

II. a. Relating to or composed of Whigs, in any use of that word; whiggish: as, *Whig* measures; a *Whig* ministry.

The hope that America would supply the main materials for the suppression of the revolt [the American Revolution] proved wholly chimerical. One of the first sets of the Whig party in every colony was to disarm Tories.

Lecky, Eng. in 18th Cent., xiv.

The Whig party was always opposed to slavery. But there was a broad and well-understood distinction between Whig opponents of slavery and the fanatical Abolitionists.

whiggamore (hwig'a-môr), *n.* [Also *whiggamor*, *whiggamore*; according to Burnet, derived from *whiggam*, as used by the men orig. called *whiggamores* (def. 1) in driving their horses; *whiggam* is a dubious word, appar. connected with *whig*², jog: see *whig*². In the glossary to the Waverley novels *whiggamore* is defined "a great whig," appar. implying a derivation *< whig*³ + Gael. *mor*, great; whereas the evidence indicates that *whig*³ is an abbr. of *whiggamore*. No Gael. form that could be the base of *whiggamore* appears; but it may be a perverted form from an original not now obvious.] 1. A person who came from the west and southwest of Scotland to Leith to buy corn. See the quotation from Bishop Burnet, under *Whig*³, 2.—2. It is 9 to 10 inches long, and 16 to 18 in extent of wings (being thus much smaller than the chuck-

will's-widow), and lacks the lateral filaments of the rictal bristles. The coloration is intimately variegated with gray, black, white, and tawny, giving a prevailing gray or neutral tone, somewhat fringed or hoary in high-plumaged males, ordinarily more brownish; there are sharp black streaks on the head and back; the wings and their coverta

are barred with rufous spots; the lateral tail-feathers are black, with a large terminal area white in the male, tawny in the female; and there is a throat-bar white in the male, tawny in the female. The bill is extremely small, but the mouth is deeply cleft, and as wide from one corner to the other as the whole length of the rictus (as figured under *fissirostris*). There has been some popular confusion between the whippoorwill and the night-hawk; they are not only distinct species, but belong to different genera, and their dissimilarity appears at a glance. Unlike the night-hawk, the whippoorwill is entirely nocturnal; it flies with noiseless wings, like the owl, and is oftener heard than seen. The notes which have given the name are trisyllabic (compare *poor-will*), and rapidly reiterated, with a strong accent on the last syllable; a click of the beak and some low muffled sounds may also be heard when the bird is very near. The eggs, two in number, are laid on the ground, or on a fallen log or stump, without any nest; they are creamy-white, heavily clouded and marked with brown and neutral tints, nearly equal-ended, and 1.25 by 0.90 inch in size. The young are covered with fluffy down. The whippoorwill inhabits the eastern half of the United States and British provinces; it breeds nearly throughout its range, but winters extraliminally. A western variety is sometimes specified as the *Arizona whippoorwill*; but the place of whippoorwills is mostly taken in the west by the poor-wills, as Nuttall's. Several other species of *Antrostomus* are found in Mexico and Central and South America.

whist² (whist), *n.* [A later form of *whisk²*. The change from *whisk²*, a word of no very obvious significance after its first application, was prob. orig. accidental, or due to an unthinking conformity to *whist¹*. The notion that the game was called *whist* "because the parties playing have to be *whist* or silent," etymologically improbable in itself, is based on the erroneous assumption that *whist* is the orig. name. The rule of silence, so far as it exists, is appar. founded, however, in part on the false etymology.] A game played with cards by four persons, two of them as partners in opposition to the other two, also partners. Partnership is determined by agreement or by cutting: if by agreement, two players, one on each side, cut for deal; if by cutting, the two who cut the lowest cards are partners, and the original deal belongs to the player who cuts the lowest card. The ace is the lowest card in cutting. Previous to play, the cards (a full pack) are shuffled. The player on the right of the dealer cuts, and the dealer, beginning with the player on his left, distributes in regular order to all the players, one at a time, the cards face downward, except the last card, which he turns face upward upon the table, at his right hand, where it must remain until his turn to play. This is the trump card, and the suit to which it belongs is the trump suit; the other three suits are plain suits. The leader is the dealer's left-hand player, who begins the play by throwing one of his thirteen cards face upward upon the center of the table. Second hand, the leader's left-hand player, follows with a card of the same suit if he holds one; if he does not hold one, with a card of a plain suit (a discard) or with a trump; third and fourth hands similarly follow; and the highest card or the highest trump played takes the trick. The trick is gathered by the partner of the winner; the four cards are made by him into a packet, and placed face downward, at his left hand, on the table. The winner becomes the leader, and the routine is continued until all the cards held are played. Tricks above six in number count a point each upon the score. The score is the record kept of the number of points made. In play the ace is highest, the king, queen, knave, 10, and 9 are also high cards, the 8 is the middle card, and the 7 to the 2 inclusive are low cards. The rank of the cards is in the above order: the queen will take the knave, the 6 will take the 5. The ace, king, queen, and knave of the trump suit are the honors. Any trump will take any plain-suit card. The usual practice is to play with two packs of cards, one of these being shuffled or "made up" by the partner of the dealer during the deal, and afterward placed by him on the left hand of the next dealer. The dealer has the privilege of shuffling before the cards are cut. The play is conducted with reference to combinations of cards held. By the system used the cards are made conversational. In *English* or *short whist* the table is complete with six candidates. When a rubber has been played by four of these (elected by cutting), the other two have right of entry. The game is of five points made by tricks and by honors as counted. Four honors held by a player, or in conjunction with his partner, count four points; three honors similarly held count two points. The winners of a game score a point (a single) if the adversaries have three or four points up; two points (a double) against one or two points up; and three points (a treble) against no score. A rubber (two games won in succession, or two won out of three) is always played. Two points for the rubber are added to the score of the rubber-winners. When three games are played, the value of the opponents' score is deducted from the winners' total. Exposed cards (cards seen when they should not be played) must be left face upward on the table, liable to an adversary's call; a card led out of turn may be called, or, instead, a card of another suit; cards played upon a trick may by any player be ordered to be placed before their respective players; a player may ask his partner if he holds a card of a suit in which he renounces; and any player may demand to see the last trick that has been turned. In *American* or *standard whist* four players form a table. These may agree upon or cut for partners. The game is of seven points, made of tricks and penalties. Credit for all points made by both sides is given, the winner of a rubber scoring the entire number of points made against the entire number made by the opponents. Cards are not called, a trick turned cannot be shown, honors are not counted, and conversation during play is not permitted. Penalties for speaking or demonstration, exposure of cards, or leading out of turn, and for revoking are payable in points after the last card of a hand is played and before the cards are cut for the next deal.

Whist is a language, and every card played an intelligible sentence.

At *Whist* there is a constant endeavor on the part of one to arrive at the maximum result for their hands by the use of observation, memory, inference, and judgment, their play being dependent from trick to trick on the inferred position of the unknown from observation of the known.

Cavendish, Card Essays, p. 6.

American *Whist* is recreative work, enjoyable labor, paradoxical as that may seem: its riddle is fascination; its practice is intelligent employment; its play is mathematical induction; its result is intellectual gain.

This was the game of the eighteenth century, played at the English clubs until that of five points with honors counting, called by Clay *short whist*, was introduced.

whitebait (hwit'bät), *n.* 1. A small clupeoid fish, prized as a delicacy in England. Whitebait are best when from 2 or 3 inches long, but retain the name up to a size of 4 or 5 inches. They abound in the estuary of the Thames and in other similar British localities at certain seasons. The fishing begins in April, and lasts through the summer; the fishes are taken in bag-nets. They are chiefly of a silvery-white color inclining to a pale-greenish on the back. Some places in England, as especially Greenwich, are famous for their whitebait dinners. The fish are usually fried till they are crisp. The identity of whitebait has been much discussed and disputed. They have been supposed to be a distinct species, named *Clupea alba*, and even placed in a genus framed for their reception as *Rogenia alba*. They have been more generally recognized as the fry of certain clupeoids, as the sprat (*Clupea sprattus*), the herring (*C. harengus*), and the shad (of one or another of the British species). But careful examinations of great quantities of whitebait, made in different localities at different times, have shown these opinions to be more or less erroneous. Whitebait consists in fact of the fry of several different clupeoid fishes, mainly the sprat and the herring, with occasionally a small percentage of yet other fishes; and the relative quantity of the different species represented varies, moreover, according to season and locality.

Whittleseya (hwit'l-si-ÿ), *n.* [Named after C. *Whittlesey* (see def.).] The generic name of a plant first found by Charles Whittlesey in the coal-measures at Cuyahoga Falls, Ohio, and named by J. S. Newberry in honor of its discoverer (1853). This plant is known only by its leaves, of which the nervation is very peculiar, excluding it from all other known genera. The generic characters, as given by Lesquereux, are—"frond simple or pinnate, nerves fasciculate, confluent to the base, not dichotomous, fructification unknown." The leaves have a peculiar truncate form, are somewhat fan-like in shape, and dentate at the upper border, but entire on the sides and rapidly narrowing into a short petiole. This plant, of which the nervation has some analogy with that of the ginkgo, was placed by Lesquereux with the *Noeggerothiceæ*; Schenk considers it as possibly belonging to the gymnosperms. *Whittleseya* has been found in various localities, always low down in the coal-measures.

(b) With reference to gender, *who* originally noted a masculine or feminine antecedent, whether human, animate, or other, the neuter being *what*; and *whose*, the possessive (genitive) of *who*, was also that of *what*, and is still correctly used of a neuter antecedent (see *what*). Moreover, before the appearance of the possessive *its*, whose place was filled by the neuter *his* (see *hel*, I. C. (b)), not only were neuter objects designated in the two other cases by *he* and *him*, but *who* and *whom* were sometimes substituted for *that* as the nominative and objective of the neuter relative (see the quotation from Puttenham). In modern use, however, *who* and *whom* are applied regularly to persons, frequently to animals, and sometimes even to inanimate things when represented with some of the attributes of humanity, as in personification or vivid description.

(c) With reference to the nature of its antecedent, *who* may note—(1) a particular or determinate person or thing (see (a)); or (2) an indefinite antecedent, in which case *who* has the force of *whosoever*, *whoever*, or *whomever*, and is called an indefinite relative.  =Syn. *Who*, *which*, and *that* agree in being relatives, and are more or less interchangeable as such; but *who* is used chiefly of persons (though also often of the higher animals), *which* almost only of animals and things (in old English also of persons), and *that* indifferently of either, except after a preposition, where only *who* or *which* can stand. Some recent authorities teach that only *that* should be used when the relative clause is limiting or defining: as, the man *that* runs fastest wins the race; but *who* or *which* when it is descriptive or coordinating: as, this man, *who* ran fastest, won the race; but, though present usage is perhaps tending in the direction of such a distinction, it neither has been nor is a rule of English speech, nor is it likely to become one, especially on account of the impossibility of setting *that* after a preposition; for to turn all relative clauses into the form "the house *that* Jack lived in" (instead of "the house *in which* Jack lived") would be intolerable. In good punctuation the defining relative is distinguished (as in the examples above), by never taking a comma before it, whether it be *who* or *which* or *that*. Wherever *that* could be properly used, but only there, the relative may be, and very often is, omitted altogether: thus, the house Jack built or lived in; the man (or the purpose) he built it for. The adjective clause introduced by a relative may qualify a noun in any way in which an adjective or adjective phrase, either attributive or appositional, can qualify it, and has sometimes a pregnant implication of one or another kind: as, *who* punish this man, *who* is innocent? i. e. seeing, or although, he is innocent (= this innocent man). But a relative is also not rarely made use of to add a coordinate statement, being equivalent to *and* with a following pronoun: as, I studied geometry, *which* I found difficult (and [I] found it difficult); I met a friend, *who* kindly showed me the way (and he kindly, etc.). This way of employing the relative is by some regarded as a Latinism, and condemned; it is restricted to *who* and *which*.

Swift, Battle of Bolinas.

whole (hōl), *a. and n.* [Early mod. E. also *wholle*; with unorig. initial *w*; prop., as in early mod. E., *hole*, < ME. *hol*, *hool*, < AS. *hāl* = OS. *hēl* = OFries. *hēl* = D. *heel* = OIlg. MHG. *G. heil*, sound, whole, saved, = Icel. *heil* = Sw. *hel* = Dan. *heel* = Goth. *hails*, hale, whole, = OBlug. *cieliū*, whole, complete; perhaps allied to Gr. *καλός*, excellent, good, hale, and Skt. *kalya*, hale, healthy (> *kalyāna*, prosperous, blessed). From *whole* (AS. *hāl*) are also ult. E. *wholesome*, *wholesale*, *wholly*, *heal*, *health*, *healthy*, and the second element of *wassail*; from the Scand. form (Icel. *heil*) are ult. E. *hale*, *hail*, etc. The change of initial *ho-* to *who-* was a dial. peculiarity, there being an actual change of pronunciation (hō to hwō), due to the labializing effect of the long *o*; the change was reflected in the spelling, which in some words, as *whole*, *whoop*, *whore*, *whot*, came into literary use, while the orig. pronunciation with simple *h* remained or prevailed. In dial. use the *who-* (*hwo-*) thus developed was afterward reduced in some districts to *wo-*, as *wot* for *whot* (orig. *whote*) for *hot* (orig. *hote*). *Whole* is one of the words which the American Philological Association and the English Philological Society include in their list of spellings to be amended, recommending the restoration of the old form *hole*, in keeping with the derived or related *holy*, *heal*, *hale*, etc. (Trans. Amer. Philol. Ass., 1886, p. 127.) I. a. 1. Hale; healthy; sound; strong; well.

Some compare Ir. *cáram*, love, *cára*, friend, L. *cárus*, dear, orig. loving (see *carress*), Skt. *chāru*, agreeable, beautiful, etc. The word was confused or homiletically associated in early ME. with ME. *hore*, < AS. *horu* (*horu*- = OS. *horu*, *horo* = OFries. *hore* = OHG. *horo*, filth, dirt. By some modern writers it has been erroneously derived from *hire*¹, as if 'one hired', the notion really present in the equiv. L. *meretrix*, a prostitute (see *meretrix*). The vowel in this word was orig. long, and the reg. mod. form would be **hoor* (hōr), the pron. hōr instead of hōr (as given by Walker beside hōr) is prob. due to the confusion with the ME. *hore*, filth, and to the later confusion of the initial *ho-* with *who-*, as also in *whole*. The word in all its forms (*whoredom*, etc.) is generally retained in the revised version of the Old Testament, though the American revisers recommended the substitution of *harlot*, as less gross; in the revised version of the New Testament *harlot* (with *fornicator* for *whoremonger*, etc.) is substituted.] A woman who prostitutes her body for hire; a prostitute; a harlot; a courtesan; a strumpet; hence, in abuse, any unchaste woman; an adulteress or fornicatress. Widmannstättian (wid-man-stet'i-an), *a.* Pertaining to Aloys Beek von Widmannstätt, of Vienna (1753-1849).—**Widmannstättian figures**, the name given to certain peculiar markings seen on the polished surfaces of many meteoric irons (siderolites) when these have been acted on by an acid. They were first noticed by Widmannstätt in 1808, on the Agram meteorite. The general appearance of these markings may be learned from the annexed figure, which is a copy of a photograph, of natural size, of a part of an etched section of the Laurens county (South Carolina) meteoric iron. The Widmannstättian figures are sections of planes of cleavage or of crystalline growth, along which segregation, or chemical change of some sort, has taken place, and whose form and position with reference to each other are in accordance with the laws governing the development of crystalline substances belonging to the isometric system. Reichenbach divided these figures into what he

Widmannstättian Figures.

called a *trias* (more properly a *triad*)—namely, kamacite (Balkeneisen), taenite (Band Eisen), and plesite (Full-eisen)—the first consisting, so far as has been as yet made out, of distinct plates of iron, with a comparatively small percentage of nickel; the second consisting of thinner plates enveloping the kamacite, and richer in nickel; and the third being a sort of ground-mass filling the cavities, and having less obvious indications of structure and generally a darker color than the others. It has frequently been stated that some meteoric irons do not exhibit the Widmannstättian figures, and that consequently their absence is not a proof of non-celestial origin; it is certain, however, that few, if any, siderolites do not show traces of some kind of structure, although investigators in this branch of science are by no means agreed as to what kind of figures are properly designated by the name *Widmannstättian*. A somewhat similar uncertainty prevails with regard to the figures developed by etching on the terrestrial iron of Ovikaf; so that, at the present time, it cannot be said that the Widmannstättian figures furnish a positive criterion by which the authenticity of a meteoric iron may be established; yet it is certain that well-developed figures of this kind do render it highly probable that the specimen in which they are seen is extraterrestrial. A classification of meteoric irons on the basis of the different forms of figures which they exhibit, in the present condition of this branch of science, does not seem to be justifiable, although this has been attempted.

4. Expressed wish with regard to the disposal of one's property, or the like, after death; the document containing such expression of one's wishes; especially, in law, the legal declaration of a person's intentions, to take effect after his death. The essential distinction between a will and any other instrument or provision contingent upon death is that a will has no effect whatever until death, and may be freely revoked meanwhile; but a deed which may create or convey an estate in the event of death must take effect as binding the grantor in his lifetime. In English law the word *will* was originally used only of a disposition of real property to take effect at death, the word *testament* being then used, as in the Roman and civil law, of a disposition of personal property; hence the phrase, now redundant, *last will and testament*. In modern usage the term *will* does not necessarily imply an actual disposition of property; for an instrument, executed with the formalities required by law, in which the testator merely appoints a guardian for his child, or merely nominates an executor, leaving the assets to be distributed by the executor among those who would take by law, is a will. In respect of form, that which distinguishes a written will from other instruments consists in the ceremonies which the law requires for a valid execution, for the sake of guarding against mistake, fraud, and undue influence. Nuncupative wills, however, are not subject to these rules. These formalities are generally four: (1) The testator must subscribe at the end or foot of the writing. (2) He must do so in the presence of witnesses. In some jurisdictions three are required. In some jurisdictions it is enough that he acknowledge to the witnesses that the subscription he has previously made is his. (3) He must at the same time publish the will—that is, declare to the witnesses that it is his will. (4) They must thereafter in his presence and at his request, and in the presence of one another, subscribe their names as witnesses. In some jurisdictions a seal is necessary with the testator's signature. One whose testimony as a subscribing witness becomes necessary to prove it can take no gift by the will.

After Christ had made his *will* at this supper, and given strength to his *will* by his death, and proved his *will* by his resurrection, and left the church possessed of his estate by his ascension, . . . he poured out his legacy of knowledge.

6. The faculty of conscious, and especially of deliberate, action. The will should not be confused (as it is, however, by different writers) with self-control, desire, choice, or attention, although the first and last of these are special modes of volition. Nor is "willing" a table to move automatically across a room an act of will; for experiment shows that effort of this kind, however strenuous, fails to cause even the willer's own hand or foot to move. Normally, the consciousness of action is merged in sensations coming from the member moved; but in cases of anesthesia the agent is still aware of being in action, and even more or less of what he is doing. This consciousness always involves a sense of opposition, whether in the form of a struggle or of a triumph, or in the negative aspect of a sense of freedom. (See *freedom of the will*, below.) We are always aware of some resistance, be it only the inertia of our limbs. Willing thus essentially involves perceptive sensation, the *reflexio* of Thomas Aquinas. (See *reflexion*, 7.) When the real object with which we are in relation is studied with reference to the predicates attributed to it by the senses, the result is experience; but when the predicates are inwardly inclined to attach to it are studied out, the operation is deliberation, terminating in choice, and commonly followed by acts of will. This cognitive process is the necessary condition of self-control. By a "strong will" is sometimes, and perhaps most correctly, meant great self-control; but more usually a power of bearing down the wills of others by tiring them out and by a domination like hypnotism is intended.

Appetite is the *Will's* solicitor, and the *Will* is Appetite's controller; what we covet according to the one by the other we often reject.
Hooker, Eccles. Polity, I. viii. § 3.

7. The act of willing; the act of determining a choice or forming a purpose; volition.

Even actual sins, committed without *will*,
Are neither sins nor shame—much more compell'd.
Fletcher (and another), Queen of Corinth, iii. 2.

It is necessary to form a distinct notion of what is meant by the word *Will* in order to understand the import of the word *Will*, for this last word properly expresses that power of the mind of which volition is the act. . . . The word *will*, however, is not always used in this its proper acceptance, but is frequently substituted for volition, as when I say that my hand moves in obedience to my *will*.
D. Stewart, Works (ed. Hamilton), VI. 345.

F. H. Bradley, Mind, XIII. 27.

Conjoint will, joint will, mutual wills, legal phrases often used without much discrimination. Especially—(a) A testamentary act by two persons jointly uniting in the same instrument, as their will, to take effect after the death of both. (b) A similar instrument to take effect as to each on his or her death. These two classes are more properly termed *joint or conjoint*. (c) Wills made in connection by two persons pursuant to a compact, binding each to the other to make the dispositions of property thus declared. (d) Wills made to bequeath the effects of the one first dying to the survivor. These two classes, and particularly the last, are more appropriately termed *mutual*. The legal effect of such wills is often a matter of doubt.—**Factum of a will.** See *factum*.—**Freedom of the will**, a mental attribute the existence of which is disputed. The phrase is taken in different senses by different thinkers. (a) The power of doing right on all occasions. (b) That freedom of which we have an immediate consciousness in action. This is, however, only the consciousness of being able to overcome some unspecified resistance to some unspecified extent, which implies and is implied in the fact of resistance, and is in fact but an aspect of the sense of action and reaction. (c) The power of acting from an inward spontaneity, not altogether dominated by motives. This is what most of the metaphysical advocates of the freedom of the will specifically contend for. It is a limitation of the action of causality, even in the material world. Some would restrict the spontaneous power of the mind to making particles serve without variation of their vis viva; but this is untenable, since the law of action and reaction, which would thus be vitiated, is far more securely proved than that of the conservation of energy, the evidence for which is imperfect, while the objections to it are weighty. It is contended on the one hand that such spontaneity is an indispensable condition of moral action; and on the other that, if it exists, it has no direct reference to morality except this that, so far as a being is spontaneous in this sense, he is free from the moral law as well as from that of causation, and that there is neither sense nor justice in holding him responsible for mere sporadic effects of pure non-cause. Responsibility, it is argued, ought to imply that a man's conduct can be regulated by principles as efficient causes, and is not free from the influence of causation.—**Free will, liberty**; freedom; liberty as to choice in faith or conduct; also, the faculty of will as being free, or not absolutely subject to causation.

Certainly there be that delight in giddiness, and count it a bondage to fix a helief— affecting *free will* in thinking, as well as in acting.
Bacon, Truth (ed. 1887).

We thus, in thought, never escape determination and necessity. It will be observed that I do not consider this inability to the notion any disproof of the fact of *free-will*.

It is much cultivated for basket-making. Also *French willow*.—**Babylonian willow** (of Psalm cxxxvii.) probably a species of poplar, *Populus Euphratica*. The weeping willow was

once supposed to be the tree, fancy associating its pendulous branches with the hanging of the harps. The cleander is sometimes selected as the tree. Compare *weeping willow*.—**Bay willow.** (a) *Salix pentandra*, a shrub or small tree of Europe and temperate Asia, having broadly ovate or oblong leaves, which are thick, smooth, and shining, rendering it highly ornamental. (b) See *willow-herb*.—**Bedford willow.** See *crack willow*.—**Bitter willow.** See *purple willow*.—**Crack willow.** (a) A tree of moderate size, *Salix nigra*, widely distributed in North America, commonly found bending over watercourses. It is native in Europe and Asia, and is often cultivated, affording, with the closely related white willow, the best willow-timber. A hybrid, *S. Russeliana*, of this and the white willow is the Bedford or Leicester willow, whose bark is said to contain more tannin than oak-bark, and more resin than most of the genus.—**Desert willow,** a small tree of willow-like habit, *Chilopsis saligna*, of the *Bigoniaceae*, found in arid regions in the southwestern United States and northern Mexico. The flowers, borne in terminal racemes, have a funnel-form corolla swollen out above, an inch or two long, colored white and purplish; the pods resemble those of *Catalpa*.—**Diamond willow,** a form of the heart-leaved willow (see below) growing on the banks of the Missouri and Yellowstone rivers, having remarkable diamond-shaped scars due to the arrest of wood-growth at the base of atrophied twigs. Also called *bitter*, *rose*, and *whispering willow*. Its bark is rich in salicin, and so bitter that it is not gnawed by animals; hence this willow is specially recommended for game-proof hedges. It is at the same time one of the best osier willows.—**Pussy willow.** See *pussy-willow*.—**Ring or ring-leaved willow,** a variety of the weeping willow with the leaves curled into rings.—**Rose willow.** See *purple willow*.—**Rosebay willow.** See *willow-herb*.—**Sage willow.** See *sage-willow*.—**Sallow willow,** the common *sallow*, *Salix caprea*.—**Sandbar willow,** *Salix longifolia*, a small tree often forming dense clumps of great beauty on river sandbars and banks. Virginia or Virginian willow. See *Itea*.—**Water willow.** See *water-willow*.—**Weeping willow,** a large tree, *Salix Babylonica*, distinguished by its very long and slender pendulous branches, a native, not of Babylon, but of eastern Asia, now common in cultivation in Europe and America. Only the female plant is known in western countries, but it spreads to some extent by the drifting and rooting of its broken branches. It is considered an emblem of mourning, and is often planted in graveyards. The Kilmarnock weeping willow is a remarkable variety of the common *sallow*. There is an American weeping willow sold in nurseries, which is a partly pendulous form of the European purple willow.—**Whipcord willow.** See *purple willow*.—**White willow,** *Salix alba*, otherwise called *Huntington* and *silky willow*, perhaps the most common cultivated species, a fine tree becoming from 50 to 80 feet high, the leaves ashy-gray or silky-white on both sides. Its wood is smooth, light, soft, tough, and not subject to splintering, and is used for a great variety of purposes. It makes a good gunpowder charcoal, for which purpose it is grown in New Jersey and Delaware. The typical form is the variety *S. eretica*, or blue willow. The variety *S. vitellina*, the golden willow or osier, with yellow twigs, is largely grown for basket-making.—**Whortle willow,** *Salix Myrsinætes*, a low, sometimes closely procurrent shrub, under a foot high, with small round, ovate, or lanceolate leaves, found in the mountains of the northern Old World.—**Willow scale.** See *scale*.—**Willow span-worm,** one of a number of geometrid larvae which feed upon willow, as the pink-striped, the larva of *Delinia variolaria* of the United States.—**Willow tussock-moth,** a northern American tussock moth, *Orgyia defuncta*, whose larva seems to feed only on willow—a peculiar fact, since other tussock-moth larvae are rather general feeders.—**Yellow willow,** the variety *vitellina* of *Salix alba*. See *white willow*, above.

II. a. 1. Made of the wood of the willow; consisting of willow.—2. Of the color of the bark of young willow-wood; of a dull yellowish-green color.—**Willow pattern,** a design in ceramic decoration, introduced by J. Turner in his Caughley porcelain in 1780. 7. To haul or hoist by or as by a winch, whim, capstan, or the like: as, to wind or warp a ship out of harbor; specifically, in mining, to raise (the produce of the mine) to the surface by means of a winding-engine; hoist. The term *wind*, as well as *draw*, is often employed in Great Britain, while *hoist* is generally used in the United States. In the early days of mining, ore and coal were almost exclusively raised by hand, horse, or steam-power, in buckets or kibles; at the present time, in both England and the United States, this is done by means of a winding-engine which turns a drum on which a rope (generally of steel wire) is wound and unwound, and by means of which a cage (see *cage*, 3 (d)) is raised or lowered, on which the loaded cars are lifted to the surface, and the empties returned to the pit-bottom. The dimensions of engines, drums, and cages in large mines are sometimes very great, as is also the velocity with which the machinery is moved. Thus, in the Monkwearmouth colliery, Durham, England, the winding-drums are 25 feet in diameter, the rope weighs 4½ tons, the cage and load 7½ tons; the vertical distance through which the cage is raised is 550 yards, and the time occupied in lifting it and discharging the cars is two minutes and four seconds.

1. Air naturally in motion at the earth's surface with any degree of velocity; a current of air as coming from a particular direction. When the air has only a slight motion, it is called a breeze; when its velocity is greater, a fresh breeze; and when it is violent, a gale, storm, or hurricane. The ultimate cause of winds is to be found in differences of atmospheric density produced by the sun in its unequal heating of different parts of the earth. These original differences of density give rise to vertical and horizontal currents of air, which constitute and establish the general atmospheric circulation, and determine permanent belts of relatively high and low pressure over the earth's surface. Differences of pressure, in turn, produce their own differences of density at the earth's surface, and thereby become a secondary cause of winds. The general system of atmospheric circulation, with respect both to surface-winds and to their correlative upper currents, is described under *trade-winds* and *anti-trade winds*, which depend upon the permanent difference of temperature between the equatorial regions and higher latitudes; (2) *periodic*, the monsoons, and land- and sea-breezes which arise respectively from a seasonal and diurnal difference of temperature between land and sea; (3) *cyclonic* and *anticyclonic*, winds associated with or constituting progressive areas of high and low pressure, the ultimate origin of which, especially of those in high latitudes, is not satisfactorily determined; (4) *whirlwinds* and (certain) *squalls*, which arise when the air is in a condition of unstable equilibrium, and are developed as a part of the process by which stability is regained (this class includes the most violent winds, such as the tornado, and these occur when the instability is the combined effect of a high temperature and a high humidity, a condition favorable to the development of the greatest possible gradients of density, and hence of the most terrific manifestations of wind); (5) *special*, winds which logically belong to the preceding classes, but which by reason of special characteristics, arising frequently from local topography, have received special appellations, as the *sirocco*, the *harmattan*, the *mistral*, the *foehn*, the *chincok*, etc. Winds are also commonly named from the point of compass from which they blow, as a *north wind*, an *east wind*, a *southwest wind*. The winds were personified and worshipped as divinities by the ancients, and representations of them are frequent in ancient art, particularly in Greek sculpture and vase-painting.

Leading wind. See *leading*.—Mountain and valley winds, in meteor., diurnal winds blowing up the sides of mountains and the trough of valleys during the day, and down during the night. They are due to differences of temperature arising from unequal heating and radiation, whereby the air at the summits of hills and mountains is heated during the day to a higher temperature than the air at the same level over the valleys or lowlands, causing a current up the valleys and mountain-sides; conversely, during the night the air at the summit is cooled by radiation to a lower temperature than the air at the same level over the lowlands, causing a downward surface flow of cold air. In narrow valleys this current sometimes attains great strength, as in the case of the Wisper wind of the Rhine.—North wind of California, a dry, desiccating north wind experienced on the Pacific slope of the United States, but especially in the Sacramento and San Joaquin valleys of California. wind-instrument (wind'in-strōm-ent), *n.* A musical instrument the sound of which is produced by a stream of compressed air, usually by the breath. Chief of such instruments is the human voice. Wind-instruments blown by the breath are divided into two classes: *wood wind-instruments*, including the flute, flageolet, oboe, clarinet, bassoon, English horn, etc.; and *brass or metal wind-instruments*, including the trumpet, horn, trombone, tuba, ophicleide, etc. Wind-instruments sounded by air mechanically compressed include the pipe-organ and the reed-organ, together with the bagpipe, and, in a certain sense, the Eolian harp. The method of tone-production in all these instruments, except the last, is either the vibration induced in a stream of air by directing it against a sharp edge, as in the flute and in flue-pipes in the organ, or the vibration induced in an elastic tongue or reed in or over an orifice through which a stream of air is driven, as in the voice, the clarinet, and the reed-organ. Sometimes both methods are used in the same instrument, as in the pipe-organ.

As perfect as the devil or himself.

windlass² (wind'las), *n.* [Early mod. E. also *windles*; a corruption of *windlas*, *windlass*, by confusion with *windlass*¹.] 1. A modification of the wheel and axle, used for raising weights, etc. One kind of windlass is the winch used for raising water from wells, etc., which has an axle turned by a crank, and

a rope or chain for raising the weight by being wound round the axle. A simple form of windlass, much used in ships for raising the anchors or obtaining a purchase on other occasions, consists of a strong beam of wood placed horizontally, and supported at its ends by iron spindles which turn in collars or bushes inserted in what are termed the *windlass-bits*. This large axle is pierced with holes directed toward its center, in which long levers or handspikes are inserted for turning it round when the anchor is to be weighed or any purchase is required. It is furnished with pawls to prevent it from turning backward when the pressure on the handspikes is intermitted. Different arrangements of gearing are applied to a windlass to exert increased power, and steam-windlasses, in which a small steam-engine is made to heave the windlass round, have come largely into use. Compare *capstan* (with cut), and cut under *winch*.

2†. A handle by which anything is turned; specifically, a winch-like contrivance for bending the arbalist or crossbow. See *crossbow*.

By heaving round the lever a considerable strain is produced.

windmolen = MHG. *wintmūl*, G. *windmühle*; < *wind*² + *mill*¹, *n.*] 1. A mill or machine for grinding, pumping, or other purposes, moved by the wind; a wind-motor; any form of motor for utilizing the pressure of the wind as a motive power. Two types of machines are used, the horizontal and the vertical. The vertical motor consists essentially of a horizontal shaft called the *wind-shaft*, with a combination of sails or vanes fixed at the end of the shaft, and suitable gearing for conveying the motion of the wind-shaft to the pump or other machinery. The older types of windmill used four vanes or sail-frames called *whips*, covered with canvas, arrangements being provided for reefing the sails in high winds. To present the vanes to the wind, the whole structure or tower carrying the windmill was at first turned round by means of a long lever. Later the top of the tower, called the *cap*, was made movable. Windmills are now made with many wooden vanes forming a disk exposed to the winds, and fitted with automatic feathering and steering machinery, governors for regulating the speed, apparatus for closing the vanes in storms, etc. These improved windmills are chiefly of American invention, and are largely used in all parts of

E. vine*, *vignette*, *vinous*, *vinegar*, *vinlage*, *vineer*, etc.] 1. The fermented juice of the grape or fruit of the vine, *Vitis*. See *Vitis*. Wines are distinguished practically by their color, their hardness or softness on the palate, their flavor, and their being still or effervescent. The differences in the quality of wines depend upon differences in the varieties of vine, and quite as much on the differences of the soils in which the vines are planted, in the exposure of the vineyards, in the treatment of the grapes, and in the mode of manufacturing the wines. When the grapes are just fully ripe, the wine is generally most perfect as regards strength and flavor. The leading character of wine, however, must be referred to the alcohol which it contains, and upon which its intoxicating powers principally depend. The amount of alcohol in the stronger ports and sherrys as found in the market is from 16 to 25 per cent.: in hock, claret, and other light wines, from 7 per cent. Wine containing more than 15 per cent of alcohol may be assumed to be fortified with brandy or other spirit. Among the most celebrated ancient wines were those of Lesbos and Chios of the Greeks, and the Falernian and Cecuban of the Romans. Among the principal modern wines are port, sherry, Bordeaux, Burgundy, champagne, Madeira, Rhine, Moselle, Tokay, and Marsala. The principal wine-producing countries are France, Germany, Spain, Portugal, Italy, Austria-Hungary, Greece, Cape Colony, Australia, and the United States.

wing (wīng), *n.* [Formerly also *weng*; *< ME. winge*, *wenge*, also with intrusive *h*] *hwinge*, *whenge*, *< Icel. vængr* = Sw. Dan. *vænge*, a wing. The AS. word for 'wing' was *fether*; cf. L. *pen-na*, Gr. *πεπέω*, wing, from the same ult. source: see *feather* and *pen*².] 1. In *vertebrate zool.*, the fore limb, anterior extremity, or appendage of the scapular arch or shoulder-girdle, corresponding to the human arm, fitted in any way for flight or aerial locomotion; or the same limb, however rudimentary or functionless, of a member of a class of animals which ordinarily have this limb fitted for flight. That modification of a limb which makes it a wing occurs in several ways: (a) In *ornith.*, by the reduction and consolidation of terminal bones of the fore limb, the reduction of the free carpal bones to two, a peculiar construction and mechanism of the joints, a compaction of the fleshy parts, and an extension of surface by the peculiartegumentary outgrowths called *feathers*. (See cuts under *Ichthyornis* and *pinion*.) Such a limb, in nearly all birds, is serviceable for aerial flight; in a few birds, as dippers, which fly through the air, also for swimming under water; in some, as penguins, only for swimming, in which case the wing is flipper-like or fin-like; in some, as the ostrich, it serves only as an aid in running; in some, as the emu, cassowary, and apteryx, it is practically functionless; it appears to have been wanting in the moas; it is a weapon of offense and defense in some birds, as the swan, and others in which it is provided with a horny spur; it is terminated with a claw or claws in some birds. The principal feathers of the wing are the remiges, rowers, or flight-feathers, those which are seated upon the hand being the primaries, those of the forearm secondaries, those of the upper arm tertiaries and scapularies, those of the thumb bastard quills; the smaller feathers, overlying the bases of the remiges, are collectively known as *coverts*. (See cut under *covert*, 6.) The various shapes of birds' wings depend to some extent upon the proportions of the bones, especially those of the pinion (see *Macrochires*), but mainly upon the development of the flight-feathers, and the lengths of these relatively to one another. Among birds which can fly probably no one shape is sharply distinguished from all others; so that the terms in technical use are simply descriptive of size, contour, and the like, as long, short, narrow, broad (or ample), pointed, rounded, vanited, etc., requiring no further explanation. See names of the sets of feathers used above, and phrases below. (b) In *mammal.*, by the enormous extension of bones of the hand and fingers, upon which, and between which and the body and leg, is stretched an extension of integument, the whole limb being lengthened, as well as its terminal segment, and there being other peculiarities of osseous structure and mechanism, as the apparent absence of one of the two bones of the forearm by extreme reduction of the ulna. Such is the condition of the forelimb of bats, or *Chiroptera*, which alone are provided with true wings and capable of true flight; for the so-called wings of various other mammals described as "flying," as the flying-squirrel, flying-phalanger, etc., are more properly parachutes or patagia, and their flight is only a prolonged leap. See cuts under *bat*, *flying-fox*, and *Pteropodites*. (c) In *herpet.*, by a modification of the fore limb comparable to that of a bat's, but peculiar in the enormous extension of an ulnar digit, and its connection with other digits and with the body by an expansion of the integument, as in the extinct flying reptiles, the pterodactyls. (See cut under *pterodactyl*.) The flying apparatus of certain recent reptiles, as the *Draco colaris*, is a parachute, not a true wing. (d) In *ichth.*, a mere enlargement of the pectoral fins enables some fishes to sustain a kind of flight; and, as the pectoral fins answer to the fore limbs of higher vertebrates, this case comes under the definition of a wing. See cut under *flying-fish*.

Wing of Bird: feathers of the wing-tract (pteryla) alarist. 1, bend of the wing, or carpal angle; 2-2, edge of the wing; 2, wing-tip, at end of longest primary; 1-2-3, the pinion, borne upon the manus, consisting of ten primaries and the primary coverts, together with the alula, or bastard wing; 3, reentrance of the wing in the middle of the posterior border of wing 2-4; 1-3-4, seven secondaries, overlaid by greater, median, and lesser rows of secondary coverts, the unshaded area forming a speculum; 4-5, three tertiaries (specialized inner secondaries); 6, root of the wing, toward the anatomical shoulder; 6-1, anterior border of the wing.

Wing of Bat: expansion of skin from the body on to elongated digits. a, shoulder; b, elbow; c, wrist; d, hind foot; 1, small free hooked thumb; 2, 3, second and third fingers, lying close together; 4, fourth finger; 5, fifth finger.

Pteropodites. (c) In *herpet.*, by a modification of the fore limb comparable to that of a bat's, but peculiar in the enormous extension of an ulnar digit, and its connection with other digits and with the body by an expansion of the integument, as in the extinct flying reptiles, the pterodactyls. (See cut under *pterodactyl*.) The flying apparatus of certain recent reptiles, as the *Draco colaris*, is a parachute, not a true wing. (d) In *ichth.*, a mere enlargement of the pectoral fins enables some fishes to sustain a kind of flight; and, as the pectoral fins answer to the fore limbs of higher vertebrates, this case comes under the definition of a wing. See cut under *flying-fish*.

2. In *entom.*, an expansion of the crust of an insect, sufficing for flight, or a homologous expansion, however modified in form or function, or even functionless so far as aerial locomotion is concerned. Such a formation, though a wing by analogy of function with the wing of a vertebrate, is an entirely different structure, having no homology with the fore limb of a vertebrate. It consists of a fold of integument, supported on a tubular framework of so-called nerves or veins, which may be in communica-

tion with the tracheæ or breathing-organs, and is consequently a respiratory as well as a locomotory organ. Most insects are provided with functionally developed (thoracic) wings, of which there are usually two pairs (mesothoracic and metathoracic); but both may be entirely suppressed, or either pair may be mere rudiments (see cuts under *halter*³ and *Stylops*), or the anterior pair may be converted into a horny case covering the other pair, as in the great order *Coleoptera*, where the anterior pair are converted into *elytra*, and in *Orthoptera*, in which they become *tegmina*. (See *wing-case*.) The form, structure, and disposition of insects' wings are very variable, but quite constant in large groups, and therefore a basis of the division of insects into orders, and of their classification: whence the terms *Coleoptera*, *Neuroptera*, *Lepidoptera*, *Orthoptera*, *Diptera*, *Aptera*, etc. See phrases below, and cuts under *nerve* and *venation*.

Wing of Butterfly: expanse of scaly integument. 1-2, front, costal, or cephalic margin; 2, apex or tip; 2-3, outer, distal, or apical margin; 3, inner or anal angle; 3-4, inner, posterior, or anal margin; 4-1, base. Several nerves or veins appear, separating wing-cells.

3. In other invertebrates, some part resembling or likened to a wing in form or function; an alate formation, as the expanded lip of a strombus.—4. An organ resembling the wing of a bird, bat, or insect, with which gods, angels, demons, dragons, and a great variety of fabulous beings, as well as some inanimate objects, are conceived to be provided for the purpose of aerial locomotion or as symbolical of the power of omnipresence.
